## Release Overview

### **Receive Email Notifications for Approval Submissions**

You can now receive email confirming approval submissions and when those submissions are updated.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions of Revenue Cloud where Revenue Cloud Approvals is enabled.

### **Manage Advanced Approvals Through Email**

With Advanced Approvals, approvers and delegates receive email when there are submissions that need their attention. They can also approve and reject submissions by responding to email.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions of Revenue Cloud where Revenue Cloud Advanced Approvals is enabled.

# E-Mail Based Notifications and Approvals

## Business Objective

Approver email notifications simplify the approval process by enabling approvers to receive and process requests via email. This feature keeps approvers informed about pending approvals and allows them to take timely action without needing to log in to perform an approval. Approvers can receive notifications through various channels, including email, which ensures flexibility and convenience.

Using Flow Orchestrator, administrators can customize the outgoing email templates for these notifications. For example, when a quote requires multi-level approvals, each designated approver at every level receives an email notification about the pending request. The notification includes essential details, such as a summary of the request, the name of the submitter, and a link to review and approve the request within the approval system.

This functionality increases the efficiency of the approval process, enabling approvers to take action promptly, regardless of their location or workload.

## Use Cases

A company is utilizing Revenue Cloud, where quotes submitted by sales representatives require approval through multiple levels. At each level, the designated approver receives an email notification regarding the pending request that requires their action. This email notification includes:

- The name of the approver
- The subject of the approval
- The name of the approval request
- Instructions on how to approve or reject the request via email

This feature allows approvers to quickly review and respond to requests without logging into the system. This capability is especially beneficial for busy approvers or those often away from their desks.

# Submitter Notifications

## Business Objective

Submitter email notifications are an essential feature of Advanced Approvals, designed to keep requestors informed about the approval status of their submitted requests. These notifications are sent via email, allowing submitters to track the progress of their requests without needing to log into the approval system. Using the Flow Orchestrator design tool, designers can quickly turn submitter notifications on or off for any approval workflow through properties. For instance, when an employee submits a purchase order using Advanced Approvals, they will receive email notifications at each approval process step. These notifications will inform them whether their request has been approved, rejected, or is still pending.

## Use Cases

A company is using Revenue Cloud, where a sales representative submits a quote that requires approval and must go through multiple levels of review. As the quote progresses through each level of the approval process, the sales representative receives email notifications updating them on the status of their submission. These email notifications may include the following details:

- The current status of the quote (e.g., In Review, Approved, Rejected).
- The name of the approver who reviewed the quote at each stage.
- Any comments from the approvers.

This feature enables the sales representative to monitor their quote's progress without needing to log into the approval system, enhancing transparency and communication throughout the approval workflow.

## Design Time Configuration

There are no constraints on design time. Advanced Approvals provides organization-wide control to enable or disable submitter notifications.

**Send Approval Work Item Assignment Emails to Approvers**

Send email notifications to the assigned user, group, or queue when an approval work item is created or reassigned. If any assigned user has a delegate, then each delegate also receives an email notification when an approval work item is created or reassigned.

**Send Approval Submission Status Email Notifications to Submitters**

Send email notifications to submitters to confirm receipt of an approval submission and to notify them about the submission's final status.
