Release Overview

Quickly and easily integrate Microsoft 365 with Salesforce Contracts through a guided setup. Use private and non-private modes during external reviews, and restart private reviews with new reviewers by using the improved privacy controls. Contract authors can configure the file attachment formats for check-in documents. Maintain consistent branding by applying custom fonts to generated documents.

- [Use a Guided Setup to Easily Integrate Microsoft 365 with Salesforce Contracts](#)
Find all the necessary steps in one place to get a clear and organized path to complete the integration. Easily configure key components and ensure an error-free setup with step validation, embedded help content, and walkthrough videos. Simplify the integration, reduce setup time, address all prerequisites, and minimize troubleshooting. Eliminate the need for rediscovery with prebuilt configurations. Resolve issues efficiently with the help of clear error messages.
- [Enhance Privacy with a Discreet External Review Process](#)
Safeguard document integrity and establish full control over your review process with additional privacy controls for external reviews. Prevent internal comments and user-specific changes from being exposed to third parties. Ensure document integrity by controlling the access for various stakeholders during different stages of the review. Contract authors can select between private and non-private modes when they share contract documents for review. In private review, the ownership of the temporary document copy is transferred to third-party reviewers and the contract author doesn't have access to this document. Comments and changes from external reviewers are anonymized. Contract authors can even restart a private review with a revised set of reviewers.
- [Specify Attachment Format During Document Check-In](#)
Contract authors can specify the file format for the document to be attached to a contract document version when they check in the document. Use the Check In Document File Type setting in Contract Type Config to control whether only .docx or both .pdf and .docx versions of the document are attached during check-in.
- [Manage Custom Fonts for Consistent Document Branding](#)
Easily align your documents with your organization's branding by using proprietary custom fonts. Upload, organize, and synchronize your font library across Hyperforce servers to ensure consistent branding in generated documents. Maintain a professional and cohesive brand identity throughout your document generation process.

DocGen New Server Side Architecture

Business Objective

Customers require higher processing throughput with improved performance for Document Generation use cases. This is applicable for Omnistudio/Core DocGen customers only. Vlocity package customers (INS, CME, PS) will continue with the existing throughput and file size limits.

Use Cases

Customers can now plan their document generation workload with batch and non-batch options and greater flexibility with improved throughput and file sizes

Design Time Configuration

NA

Additional Notes

New architecture is introduced for Server side scaling with improved performance for both batch and non-batch document generation processing. **The new DocGen architecture works only for [DocGen 2.0](#)**

- Up to and including the Winter '25 Revenue Cloud Advanced release, performance throughput per Org for server side batch processing is limited to 1,000 per hour per Org. Beginning with the Spring '25 release, throughput is increased to 2,500 per hour per Org.
- In the Spring '25 release of Revenue Cloud Advanced, the file size support increased to 10 MB pdf output file size
- Non-batch document generation has a limit of 1,000 per hour per Org. This is applicable for Omnistudio & Core DocGen only

MS 365 Guided Setup

Business Objective

The Spring '25 Revenue Cloud Advanced release introduces an improved, more streamlined configuration experience when integrating the Microsoft 365 Add-In for SF Contracts into Revenue Cloud. The new feature reduces complexity, time to complete the integration and configuration, and improves the overall customer experience.

Use Cases

When customers try to establish integration with Microsoft 365, they are required to complete an extensive set of manual, often disjointed steps requiring interaction with both the Microsoft platform and Salesforce. This often leads to user confusion and system misconfigurations resulting in a poor customer experience and ultimately product adoption is impacted. The setup and integration process needs to be streamlined, error proof, and much more intuitive from an end user perspective.

Setup Configuration

The Revenue Cloud Advanced Spring' 25 release enables customers to use a guided setup experience to create or update their MS 365 related configuration steps. This not only has step by step flow, it also includes a number of validations, short videos and help links. This is included with the base Salesforce Contracts licenses and requires no additional licensing

Collaborative Redlining in Private Mode

Business Objective

When performing document redlining between multiple parties, customers need to be able to send the documents to an external party for redlining without exposing the internal comments and user details to the other party. In the current scheme, all changes performed by internal stakeholders are exposed to other parties (external) and vice versa. A segment of customers require privacy when internal and external users are redlining during the contract negotiation phase. This feature - Collaborative Redlining in Private Mode delivers document privacy capabilities.

Use Cases

The users would be able to add the external reviewers using their email ids and send them a document link to include them in the document review and readline process. The external reviewers can then share the documents internally within their org to redline the document. Once satisfied the primary contacts can share the document back to the originator allowing the author to review the document and reconcile it using MS Add-in for SF Contracts.

Additional Notes

Introduced into the Spring '25 Revenue Cloud Advanced release, customers are able to use the private mode redlining feature to redline documents in a private mode. There is minimal additional setup required to enable this mode. This is included with the base Salesforce Contracts licenses and requires no additional SF or Microsoft licensing.

Dynamic Images in DocGen Server Side

Business Objective

Salesforce Revenue Cloud Advanced customers need the ability to render images dynamically during server side processing. This includes the ability to define relevant image tokens in the templates and pull in images from different repositories during server side document processing.

Use Cases

As a document manager user, I need to create an end user document, such as a quote or order form, incorporating end customer logos into the final document rendering. I need to optionally include a photograph from an image repository when creating a business document. Image insertion can range from a simple insertion of a single identifiable image to conditionally inserting a series of images into the document.

Design Time Configuration

To insert dynamic images into a generated document

- First store the images in the Salesforce org
- You can store the images in the Files tab, and the Documents tab.
- Create custom text fields in any object from where you want to fetch your image.
- Map the uploaded images to the custom fields using the image API names.
- Add image tokens in the document template
- Provide data mapping in the Data Mappers (Extract and Transform),
- Generate the document with dynamic images.
