Release Overview

Save and reuse your configurations, design bundles faster with streamlined rules and dynamic configurations, and use decimal quantities. Create constraint models with CML and customize product cards and UI elements for better visibility and control.

- [Create Quotes and Orders Faster by Saving and Reusing Configurations](#)
Sales reps can save their frequently used configurations, and then reuse them with just a few clicks. Use the saved configurations to quickly create quotes and orders even when they're working with complex bundles and products.
- [Create Precise Configurations with Decimal Quantity Support](#)
For products that are measured with decimal precision, your sales reps and rule designers can enter decimal values for the quantity when they configure the products and define the rules. Sales reps and rule designers can also see the associated unit of measure record and an infobubble that shows the number of decimal values that the value is rounded off to. For attributes that require a decimal input, your sales reps and rule designers can see the associated unit of measure record. However, attribute values aren't rounded off.
- [Design Product Configurations Faster With Product Classes and Flexible Rules](#)
Rules for creating product bundles are now simpler and more flexible. You can define a class of values to display in dropdowns at run time, as opposed to statically defining the dropdowns. Also, when defining a rule with a condition, you can choose anything that's related via Context Service mappings. These changes make your rules more compact, faster to create, and easier to maintain.
- [View More Products at Once with Compact Mode in Product Configurator](#)
With compact mode, see more products onscreen and work with large bundles more easily. Use the toggle to turn Compact Mode on and off.
- [Find Products in a Large Bundle Easily](#)
Use the search field in Product Configurator to easily find a product in the current bundle. To show the search field, make sure that the product configuration flow contains the Product Configurator Breadcrumb Navigation component (included by default in the Default Product Configurator Flow).
- [Show More Details About Your Products with Customized Product Cards](#)
Select the fields that you want to show on a product card and capture the information that isn't covered in the default card layout. To select fields in the Product Configurator Option Groups component, choose up to 5 options in each of the two picklists. The selected fields appear in two rows in the product card, with options from the first picklist in the top row.

- [Set Up Complex Product Validation Rules Easily by Using Advanced Configurator \(Closed Beta\)](#)

Rule designers can set up validation rules for complex product configurations by using Advanced Configurator (closed beta) in Product Configurator. Based on your business requirements, you can use Advanced Configurator or the existing Standard Configurator. After you enable Advanced Configurator, rule designers can use Constraint Builder (closed beta) to create advanced configuration rules.

- [Configure Complex Products Accurately with Constraint Models \(Closed Beta\)](#)

Manage the complex configuration and validation for your products by using constraint models. Create constraint models in the Constraint Builder, a part of the Advanced Configurator, to use constraints in addition to if-then rules to customize complex products quickly and accurately.

- [New Configurator Flow Component Fields](#)

Ensure more control over layout and other functions by using the new fields added to the Product Configurator Flow screen components.

Large Bundle Support in UI

Business Objective

Customers who sell bundles with high volumes of product options can navigate more easily between the products by searching and using compact mode

Use Cases

1. A sales person who works for a high tech company who sells servers with high volume of server configured options, can search a particular product option and/or switch to compact mode to view more products at a single glance

Design Time Configuration

None

Configuration and Runtime Video

[Salesforce Configuration Search and Compact Layout.mp4](#)

Custom Field Mapping

Business Objective

Customers who require a customized layout for the product card within the configuration flow can now customize it using any available context tag within the configured context definition

Use Cases

Verticals who need to surface specific service/product information to the sales person, so he can focus on the sales motion, while the important information is in front of him

Design Time Configuration

1. In setup, through the quick find box, search for Flows and click on the Flows menu
2. In the Flow screen, click on the name hyperlink of the configurator flow in use, by default the product has the Default Product Configurator Flow, but your solution may use another .

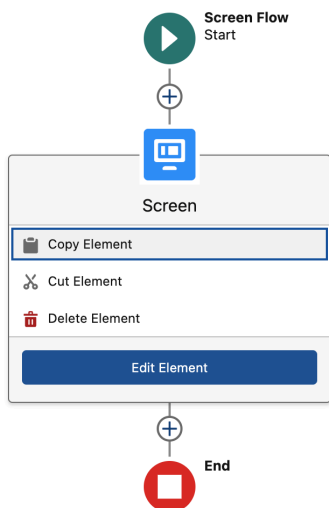

Default Flow example

Default Product Configurator Flow	Screen Flow	☒	☒	Managed-Install...
---	-------------	-------------------------------------	-------------------------------------	--------------------

Custom Flow example

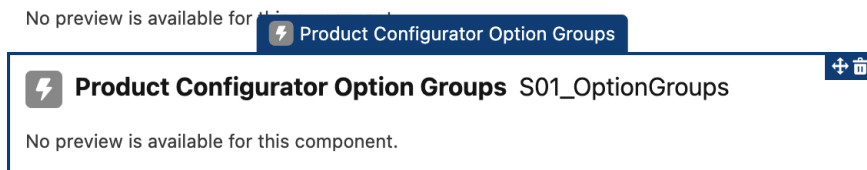

Custom Product Configurator Flow	Screen Flow	☒	☐	Unmanaged
--	-------------	-------------------------------------	--------------------------	-----------

3. In the Flow diagram that opens click on the screen element and choose Edit Element

- The screen flow element will now display all the flow components. Scroll down and choose Product Configurator Option Groups

- On the right pane scroll down to context definition. Fill it up with the relevant context definition that you are using for pricing (tip: check revenue setting in setup to view the used context for pricing and then check the pricing procedure to get the exact context).
- Continue to select up to 5 fields for the upper and bottom parts of the card. See example:

Context Definition ⓘ

PricingTransactionCD2

Select up to 5 fields ⓘ

Available		Selected
ArePartialPeriodsAllowed	▶	ProductName
BillingFrequency	◀	ProductCode
BillingReference		
BillingTreatment		
ContractAttributePasId		
ContractDiscountType		

Select up to 5 fields ⓘ

Available		Selected
ArePartialPeriodsAllowed	▶	ListPrice

- Once done configuring the desired fields to display on the cards, save the flow (either newer version of the existing flow, or with a new name) and activate it
- Go to  and launch Product Configuration Flow
- Check if a Product Configuration Flow exists. If it exists, ensure its pointing to the above flow API. If none exists, create one and fill the Flow API name in the Flow Identified field.
- Mark the Product Configuration Flow as default or go to the related tab and add a specific product in Product Configuration Flow Assignment to apply the flow for.

See example

Product Configuration Flow

Product Configuration Flow Name	00000002	Default
Flow Identifier	X2025_config_flow	☒
Status	Active	

11. Test it by going to the quote page, browsing the catalog and choosing a bundle to configure. The product option card should display the fields configured in step #6

[Salesforce Configuration Custom Field Mapping](#)

Save Configuration

Business Objective

Sales reps often need to create the same or similar configurations of a given product while working on different quotes but they have to start configuring from scratch every time. Sales reps can now save their frequently used configurations, and then reuse them with just a few clicks

Use Cases

- Save a frequently used product configuration
- Load from saved configurations to quickly create quotes and orders even when they're working with complex bundles and products.

Design Time Configuration

N/A
