Release Overview

Process incoming orders depending on their priority and quantity. Assetize and hand over fulfilled products to customers without delay, independent of other in-progress items. Link, review, and act upon dependent steps that are part of other fulfillment plans. Automate manual task assignments with custom rules, routing tasks to specific users, queues, or those users with the least workload. Track all changes in your fulfillment steps from a comprehensive history view. Plan and run fulfillment order line items on a specified future date and time. Decompose and fulfill ramp deal orders directly with Dynamic Revenue Orchestrator. Decompose products with quantities that are in decimal format.

- **Prioritize Orders for Processing**
Process order submissions based on defined priority levels—High, Default, or Bulk. Dynamic Revenue Orchestrator processes high-priority transactions with established hourly limits. Manage the default and bulk transactions so as to make the most of system resources.
- **Optimize Fulfillment Efficiency with Staged Assetization**
You can now assetize fulfilled products individually, without waiting for the entire fulfillment plan to finish. This change facilitates faster revenue recognition, especially when dealing with partially fulfilled orders.
- **Manage Dependencies Across Related Fulfillment Plans**
Make sure that your fulfillment plans are connected and aligned by enabling fulfillment designers to establish cross-plan dependencies between steps that should be part of different fulfillment plans. Fulfillment managers can view and easily access dependencies directly from the plan view. Reduce manual effort and time by using this real-time visibility to act on the steps that require attention.
- **Define Rules to Assign Manual Tasks**
When configuring tasks, fulfillment designers can now use the new task-assignment rules to automatically assign tasks to a specific user or a queue. They can customize the rules and set conditions and priorities. For example, assign tasks to a resource with the least current workload or use a specific context for the assignment.
- **Track Your Fulfillment Step Changes**
Gain a clear understanding of the progress and status of each step, improving your ability to manage and optimize the fulfillment process. The step details page now shows the activity history.
- **Configure Future Dated Steps**
Fulfillment designers can now configure steps to execute at a future date and time. They can also set intervals between the start date of the order line items and the execution time of previous steps.

Prioritize Orders for Processing

Business Objective

This feature gives options to prioritize orders during the order intake process and define a priority of either High, Default, or Bulk.

- High-priority orders provide an option to bypass the regular queue of default order processing, so orders can be expedited with a higher execution priority in advance of other lower priority orders. This is particularly useful for urgent requests, where timely processing is crucial.
- Default orders, on the other hand, are the routine orders that are processed in the order they are received, following the standard procedures and timelines.
- Bulk priority setting is suitable for when orders are submitted in large batches and their fulfillment is not time-sensitive.

Use Cases

Use case 1: In a Hi-Tech company specializing in antivirus licenses, managing order priorities is crucial for operational efficiency and customer satisfaction. The default priority is assigned to routine day-to-day orders, ensuring a steady workflow. High-value customers, who contribute significantly to revenue, are given high priority to expedite their orders and maintain strong relationships. Additionally, bulk orders are prioritized for the cancellation of expired subscription licenses in batches, streamlining the process and reducing administrative overhead. This structured approach to order prioritization ensures that critical tasks are handled promptly, enhancing overall service quality and customer loyalty.

Use case 2: In the health insurance industry, high-priority orders, such as emergency approvals for critical procedures like surgeries or transplants, are processed immediately to ensure that patients receive the necessary medical care without delay. Default orders, which include individual policy issuance, are handled within a standard timeframe for single policy purchases by individuals. Bulk claims processing, on the other hand, involves the settlement of claims from healthcare providers or hospital chains, and these are typically processed in batches.

Design Time Configuration

No configuration needed

Run Time Configuration

1. At time of submitting order, customers can pass below parameters in Order Submit Invocable Action
 - a. fulfillmentPriority: "High/Default/Bulk"
 - i. High: For High Priority Order
 - ii. Default: Normal day to day order (default value)
 - iii. Bulk: Batch or high volume , low priority orders
 - b. priorityLimitAction: "Reject/Downgrade"
 - i. Downgrade: Automatically downgrade high priority order to default order once High priority quota is exhausted (default value)
 - ii. Reject: Reject the high priority order once high priority orders quota is exhausted

```
{
  "inputs": [
    {
      "orderId": "801xx000003GYiBAAW",
      "callType": "Synchronous/Asynchronous",
      "fulfillmentPriority": "High/Default/Bulk",
      "priorityLimitAction": "Reject/Downgrade"
    }
  ]
}
```

2. Once order is submitted, Go to the Decomposition viewer and click on the view plan

Configure Steps for Future Execution

Business Objective

This feature allows for the immediate purchase of products or services while enabling fulfillment at a future date. This enhancement empowers fulfillment designers to configure and schedule specific steps to be executed at a later time. They can now set delays for these steps based on either the start date of the source line items or the completion time of preceding steps. This flexibility ensures that the fulfillment process aligns perfectly with customer needs and operational timelines, enhancing overall efficiency and customer satisfaction.

Use Cases

In the manufacturing industry, a company producing custom machinery uses a Just-In-Time (JIT) inventory management approach to optimize costs and ensure timely production. By leveraging the new feature, the company places immediate orders for specialized components while scheduling their future delivery to align with the production process. Fulfillment designers configure the system to delay component delivery based on the production schedule or previous manufacturing steps. This ensures components arrive just in time, reducing inventory costs and enhancing supplier coordination. The approach streamlines production, improves efficiency, and supports cost-effective JIT inventory management.

Design Time Configuration

1. In Setup, find and select Dynamic Revenue Orchestrator Settings, and then turn on Future Dated Steps.

Salesforce Revenue Cloud Dynamic Revenue Orchestrator Spring '25

Dynamic Revenue Orchestrator
Take advantage of the powerful fulfillment capabilities of Dynamic Revenue Orchestrator (DRO).

General Settings

- Dynamic Revenue Orchestrator**
Drive agility, simplicity, and visibility into any product fulfillment journey using the integrated platform Dynamic Revenue Orchestrator. ☒ On
- In-flight Amendments**
Allow changes to fulfillment requests that are in progress. ☐ Off
- Future Dated Steps**
Execute fulfillment steps on a future date. ☒ On
- Link Task to Step Source**
Link a Salesforce task to a fulfillment step source. ☐ Off
- Fulfillment User**
Select the user who runs the fulfillment process.
☐ User who submitted the order
☒ Other User

2. In the Dynamic Fulfillment Orchestrator app, select the Fulfillment Workspaces and create a workspace or select a workspace from the Recently Viewed section.

3. Create the Fulfillment Step Group, add a step, and enter the details. See [Create a Fulfillment Step Definition Group](#) and [Add a Fulfillment Step Definition to a Fulfillment Step Group](#).

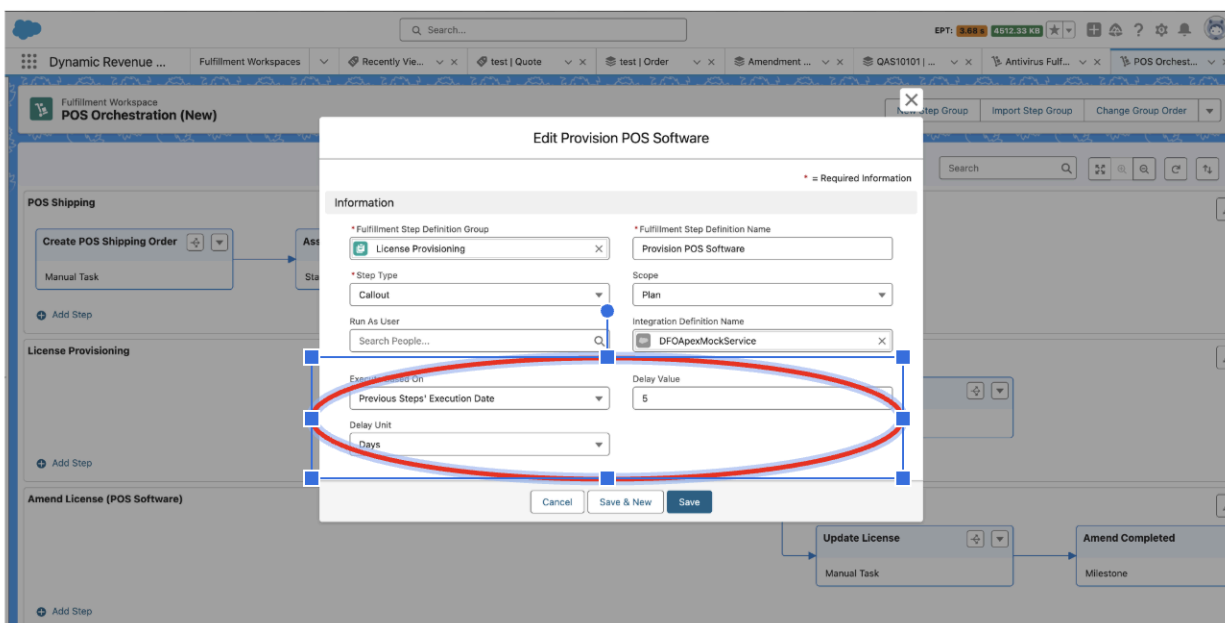

Salesforce Revenue Cloud Dynamic Revenue Orchestrator Spring '25

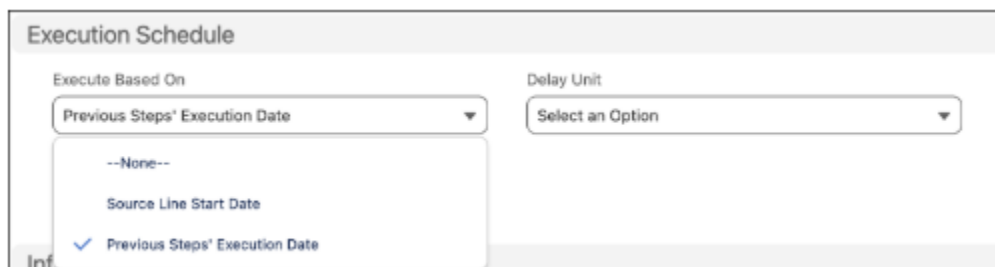

4. To edit a step, select Edit from the dropdown.

5. Specify the execution schedule.

Execute Based On Value	Action
Source Line Start Date	To schedule the execution based on the start date of the source.
Previous Steps Execution Date	To schedule the execution based on the execution date of the previous steps.

- To set a delay depending on the specified execution schedule, select the delay unit, and enter a positive number as the delay value.

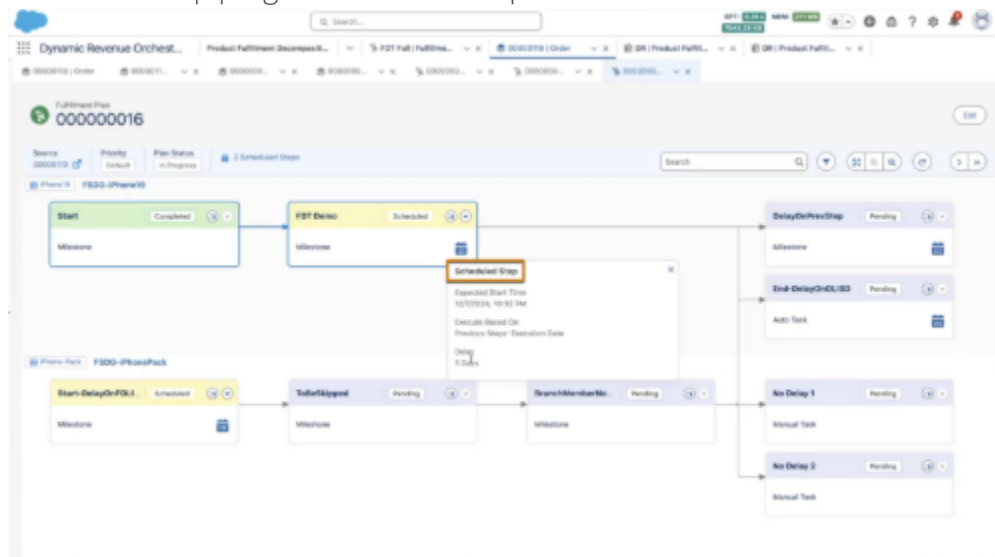

7. Save your changes.
8. Create and submit the order to DRO.

Run Time

After you submit the order to DRO, go to Fulfillment Lines and select View Fulfillment Plan to view the step status, details, and dependencies.

The scheduled steps are highlighted in yellow and the  icon appears next to the scheduled steps. When you hover over this icon, you can view details such as the expected start time, execution criteria, and delay.

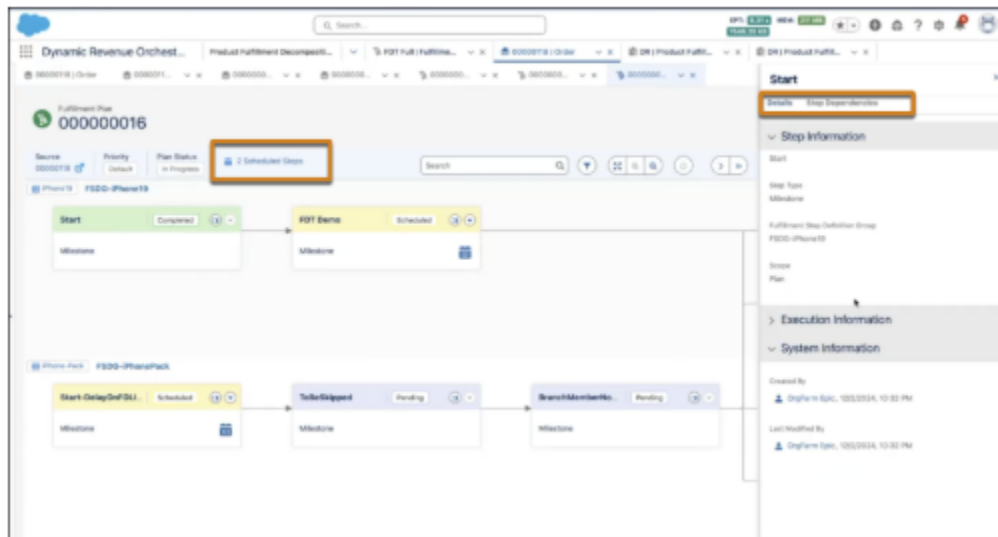

You can also view the total number of steps scheduled in the header. This number is updated when each step progresses to the completed state.

Click the icon on a step to view the details of the step.

- On the Details tab, you can view:
 - General information about the step.
 - Execution information such as the actual start date and completion date of the step.
 - System information such as the details of the user who created and modified the step.
- On the Step Dependencies tab, you can view the dependencies related to the step.

Manage Dependencies Across Related Fulfillment Plans

Business Objective

In certain scenarios, it may be necessary to split a plan into multiple plans. This could be for reasons such as converting quotes into multiple orders, tracking requests individually, or breaking down complex work orders. However, this can sometimes result in tasks that depend on each other being placed in different plans.

To address this, the Dynamic Revenue Orchestrator feature allows you to create dependencies between fulfillment steps across different plans. This feature enables you to define a scope that encompasses multiple fulfillment plans, ensuring that dependent steps in one plan can wait for the completion of steps in another plan.

By organizing steps in the Fulfillment Workspace, you can ensure that all dependent tasks are properly coordinated, regardless of the plan they belong to.

Use Cases

A manufacturing company receives a large order to produce a complex piece of machinery. The order is split into multiple plans to manage different components: one plan for fabricating metal parts, another for assembling electronic components, and a third for final assembly and testing. Each of these plans has tasks that depend on the completion of tasks in other plans.

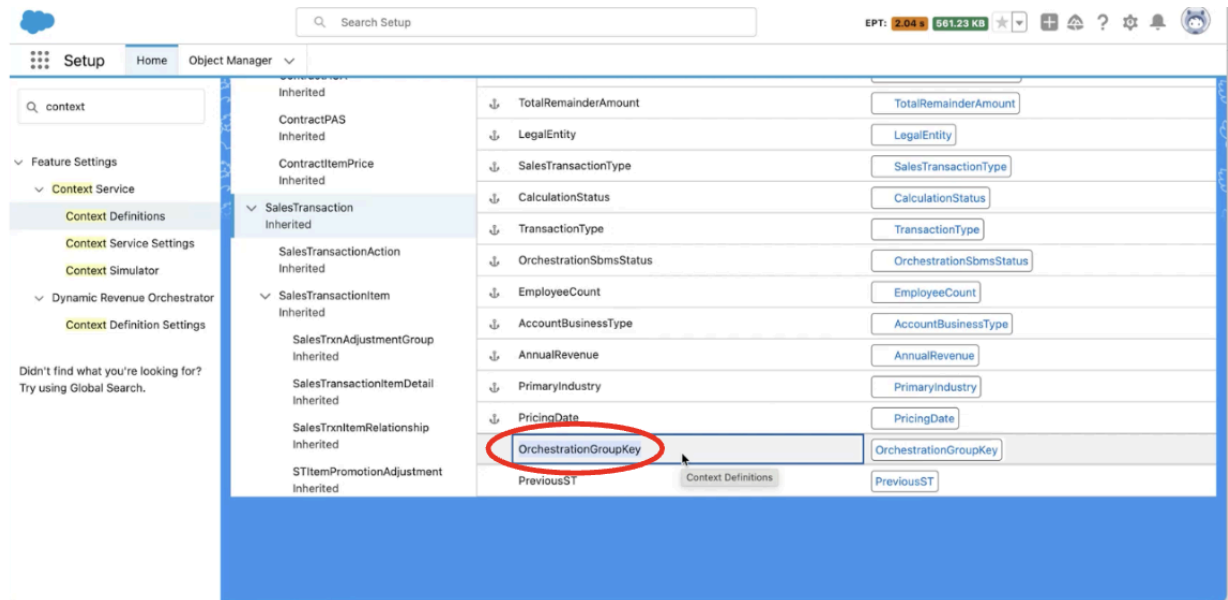

For instance, the final assembly cannot begin until both the metal parts and electronic components are ready. Using the Dynamic Revenue Orchestrator, the company can create dependencies between these fulfillment steps across different plans. This ensures that the final assembly plan waits for the completion of the metal fabrication and electronic assembly plans. By defining a scope that covers all these plans, the company can efficiently coordinate the entire production process, ensuring timely and synchronized completion of the machinery.

Design Time Configuration

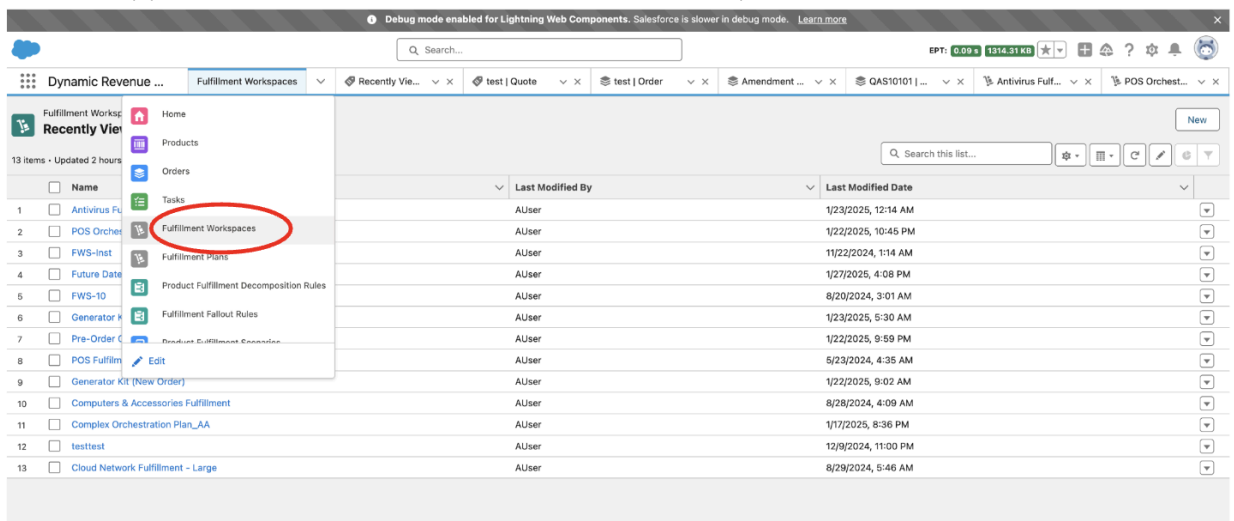

Fulfillment designers configure cross-plan dependencies between fulfillment step definitions. For example, link the Activate Service step in one group with the Bill Customer step in another group, making sure that the customer is billed only after the service is activated.

Note: To use the Cross Plan scope, make sure that you configured the Cross Plan context definition in Sales Transaction Context Definition. Then import the fulfillment step groups of the other plan within the Fulfillment Workspace. See [Custom Context Definitions](#). Here, Use Order Description field in Order Product to map with OrchestrationGroupKey Tag in the new Context definition

1. From the App Launcher, find and select Fulfillment Workspaces

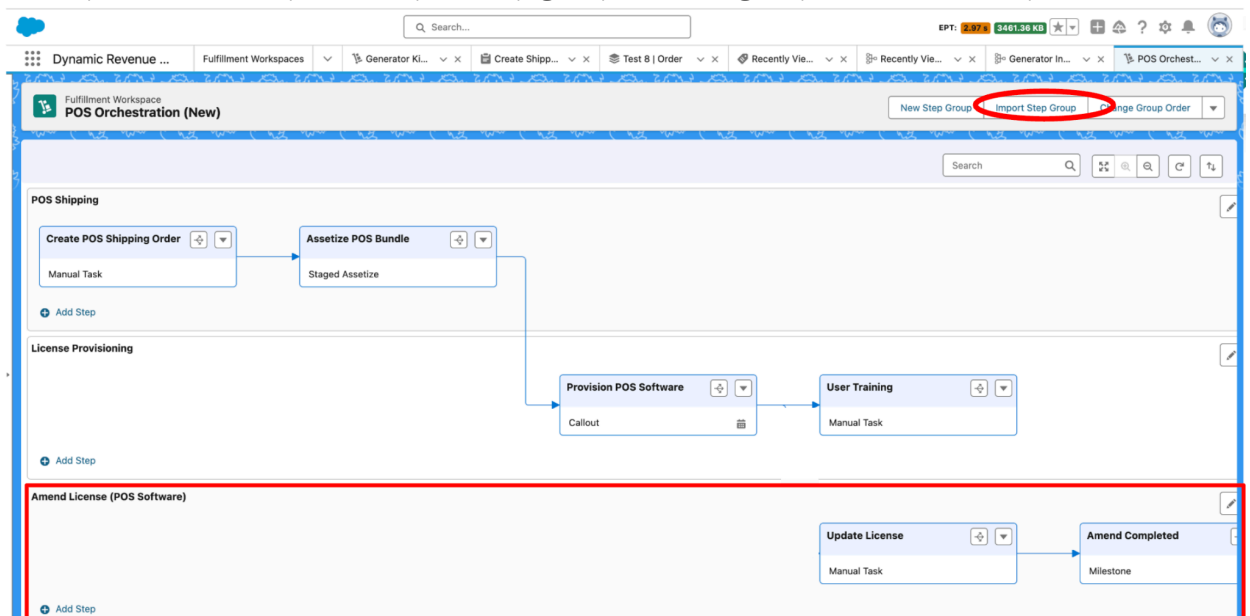

2. Create a new workspace or open an existing workspace. In this example, we will open an existing workspace

	Name	Last Modified By	Last Modified Date
1	Antivirus Fulfillment	AUser	1/23/2025, 12:14 AM
2	POS Orchestration (New)	AUser	1/22/2025, 10:45 PM
3	FWS-inst	AUser	11/22/2024, 1:14 AM
4	Future Dated Step Workspace	AUser	1/27/2025, 4:08 PM
5	FWS-10	AUser	8/20/2024, 3:01 AM
6	Generator Kit (New)	AUser	1/23/2025, 5:30 AM
7	Pre-Order Generator	AUser	1/22/2025, 9:59 PM
8	POS Fulfillment Plan	AUser	5/23/2024, 4:35 AM
9	Generator Kit (New Order)	AUser	1/22/2025, 9:02 AM
10	Computers & Accessories Fulfillment	AUser	8/28/2024, 4:09 AM
11	Complex Orchestration Plan_AA	AUser	1/17/2025, 8:36 PM
12	testtest	AUser	12/9/2024, 11:00 PM
13	Cloud Network Fulfillment - Large	AUser	8/29/2024, 5:46 AM

3. In workspace, steps between which cross plan dependency is required should be present. You can import the step group which contains the step for which cross plan dependency is required. Eg if you want to create a cross-plan dependency between step A1, present in Step group B1 (Workspace C1) and step A2 present in Step group B2 (Workspace C2), then please import step group B2 having step A2 in the workspace C1.

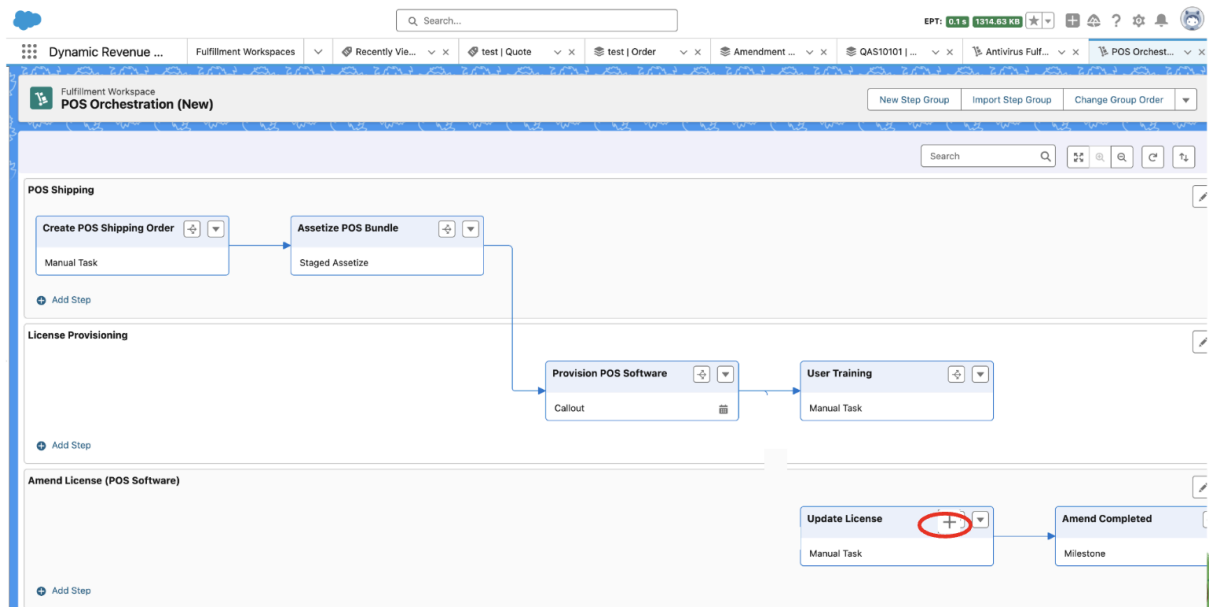

4. On the step definition that must finish first, click the Dependency icon.

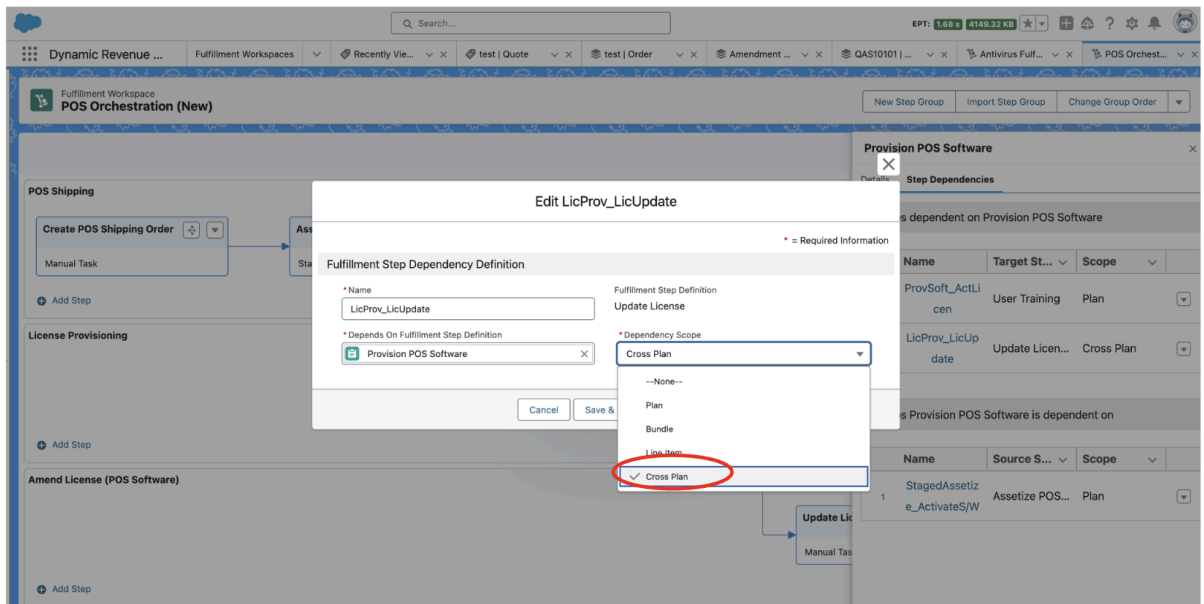

- Click The Add icon in a step definition that depends on the one that you want to finish first.

- The New Fulfillment Step Dependency Definition pane opens.
- Enter the name of the dependency definition, set the dependency scope, and save your changes.

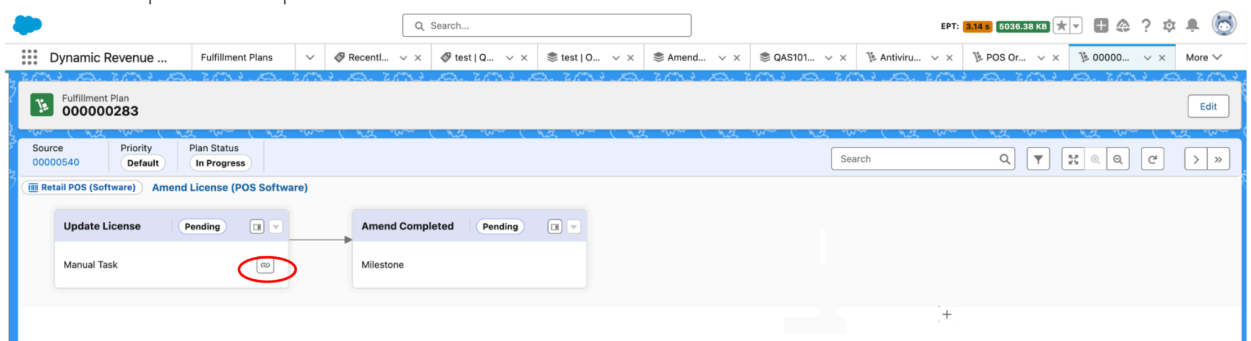

8. The Fulfillment Workspace arranges the step definitions in the order that they are completed when an order is submitted.

Run Time

During fulfillment, manage dependencies to:

See the steps that have cross-plan dependencies, and review the steps within the fulfillment plan

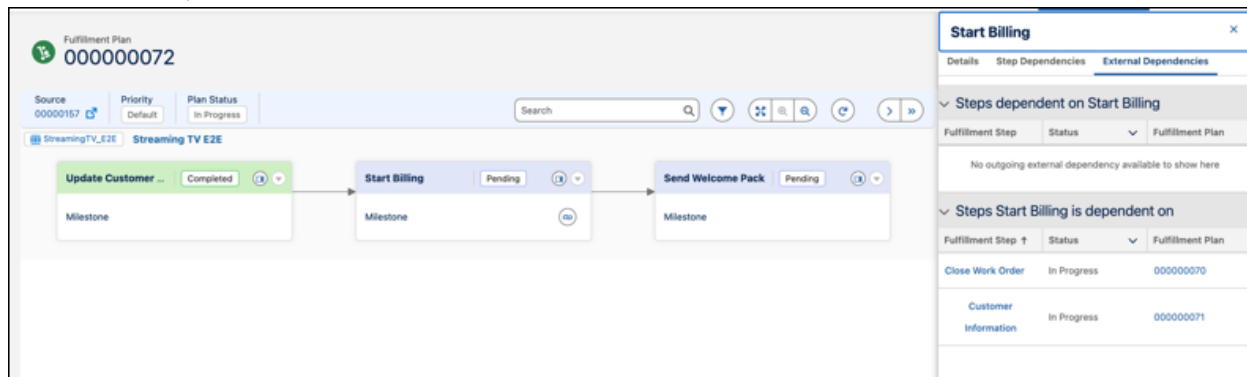

1. From the App Launcher, find and select Orders.
2. Click an Order, then in the order page, click on Details tab
3. Provide the unique id as your Group key in the field that you have mapped with OrchestrationGroupKey tag in context definition. Here will Order field that is mapped with OrchestrationGroupKey is Order Description
4. Click the Fulfillment Lines tab.
5. Click View Fulfillment Plan to see the plan.
6. To get more information or act on the step, hover over a step, or click its button and icons.
7. View the cross plan dependencies: Click View External Dependencies on a step to open the panel showing the External Dependencies tab. See the external step dependencies related to the step. Click a step or plan to open its details page, and take actions such as edit or complete a step.

Note The External Dependencies icon appears only if there is at least one external dependency.

Cross Plan Dependencies

Configuration and Runtime Video

 [Cross Plan Dependency Video](#)

Optimize Fulfillment Efficiency with Staged Assetization

Business Objective

Use a staged assetize step to independently assetize standalone or bundled products, even if other order line items are still being processed. The Staged Assetize step is specifically applicable for long-running orders that span hours, days, weeks, or months.

Use Cases

Consider a customer who orders both a custom website and a domain name. The domain name registration is completed quickly, but the custom website development may take several weeks. In the meantime, the customer decides to add email hosting to their domain. Because the domain name has already been assetized, the service provider can add the email hosting without waiting for the website development to be completed.

Design Time Configuration

Use a staged assetize step to independently assetize standalone or bundled products, even if other order line items are under process. At design time, the fulfillment designer can configure the necessary assetization tasks so that the line item or bundle assetizes after all its dependent steps are completed.

After you create a fulfillment step definition group in the workspace, add a fulfillment step definition to it. When an order is submitted, Dynamic Revenue Orchestrator (DRO) creates a fulfillment step in the Fulfillment Plan based on this definition.

1. From the App Launcher, find and select Fulfillment Workspaces.

Salesforce Revenue Cloud Dynamic Revenue Orchestrator Spring '25

The Staged Assetize step is typically applicable for long-running orders that span hours, days, weeks, or months. For example, consider a customer who orders both a custom website and a domain name. The domain name registration is completed quickly, but the custom website development can take several weeks. In the meantime, the customer decides to add email hosting to their domain. Because the domain name was already assetized, the service provider can add the email hosting without waiting for the website development to be completed.

STAGED ASSETIZE STEP APPLIED TO	ITEMS CONVERTED TO ASSETS
Fulfillment Order Line Items	Standalone order line items and the related fulfillment order line items.
Order Line Items	Order line items and the related fulfillment order line items.
Root product bundle containing order line items	Entire bundle and the related fulfillment order line items.
Root product bundle containing fulfillment order line items	Entire bundle containing fulfillment order line items.
Non-root product in a bundle containing order line items and fulfillment order line items	None. The step is skipped.
Ramp Orders	None. The step is skipped, and all segments are assetized only when the fulfillment plan is completed.

Configuration and Runtime Video

 [Staged Assetization Video](#)

Define Rules to Assign Manual Tasks

Business Objective

When configuring tasks, fulfillment designers can now use the new task-assignment rules to automatically assign tasks to a specific user or a queue.

Create reusable rules to automatically assign manual tasks to users based on criteria and conditions defined in the rule. DRO applies this rule and assigns the task to a person based on the matching source in the step definition, step assignment method, results of the applied conditions, and priority of the rule. Two new rules added are

- Least Loaded: Assigns the task to the person with the fewest open task assignments.
- Context Based: Assigns the task to a person based on the specifications in the associated fulfillment task assignment rule. It can either be the next available person (Round Robin) or the person with the fewest open task assignments (Least Loaded).

Use Cases

A retail company aims to streamline its order fulfillment process by leveraging new task-assignment rules. Fulfillment designers can now create reusable rules to automatically assign manual tasks to users based on specific criteria. For instance, when an order is placed, the system can use the "Least Loaded" rule to assign the task to the employee with the fewest open tasks, ensuring balanced workloads. Alternatively, the "Context Based" rule can assign tasks either in a round-robin fashion or to the least loaded employee, depending on the task's context. This automation enhances efficiency, reduces manual intervention, and ensures timely order processing.

Design Time Configuration

After you create a fulfillment step definition group in the workspace, add a fulfillment step definition to it. When an order is submitted, Dynamic Revenue Orchestrator (DRO) creates a fulfillment step in the Fulfillment Plan based on this definition.

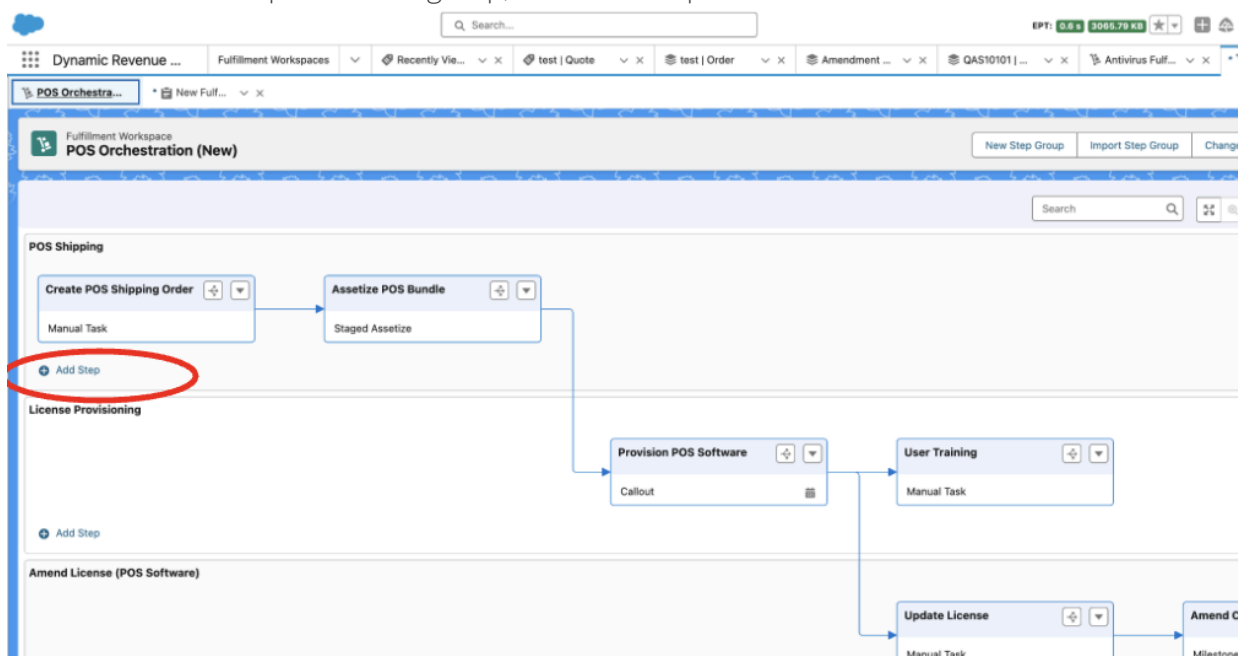

1. From the App Launcher, find and select Fulfillment Workspaces.

Salesforce Revenue Cloud Dynamic Revenue Orchestrator Spring '25

☐	Cloud Network Fulfillment - Large	AUser	8/29/2024, 5:46 AM	

2. In the fulfillment step definition group, click Add Step.

3. Add a manual task to orchestration when you need user input at a particular place in the fulfillment flow. For example, when you need an approval or manual enrichment of data. Dynamic Revenue Orchestrator can assign a manual task to a user or a queue.

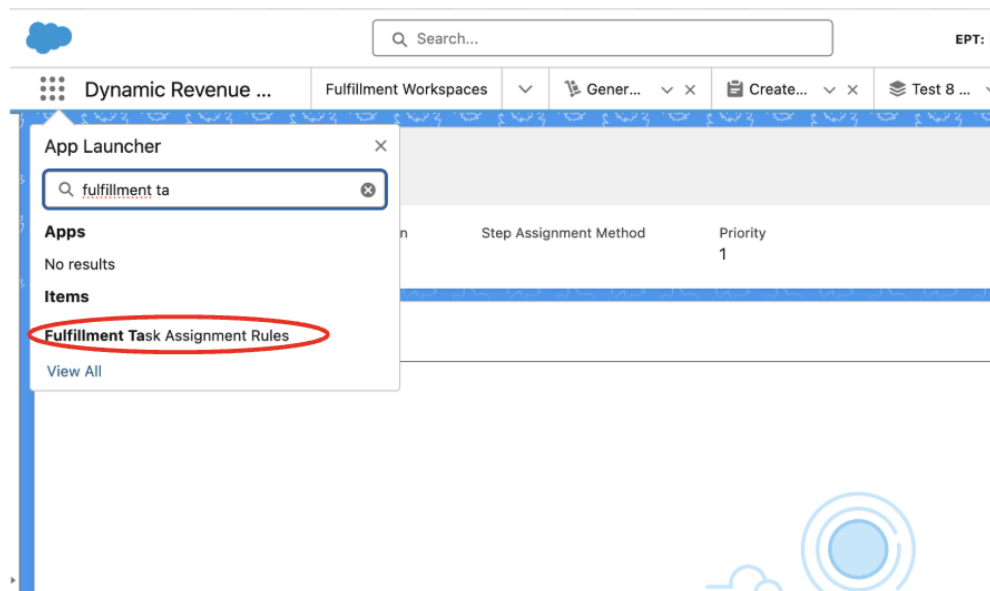

New Fulfillment Step Definition

* = Required Information

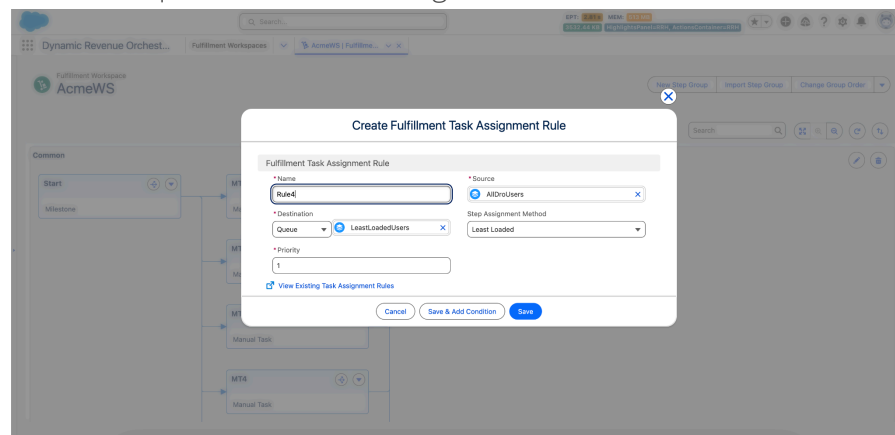

Information

* Fulfillment Step Definition Group POS Shipping * Step Type Manual Task Run As User Search People... Assigned To User Assigned To Flow Definition Name Execute Based On --None--	* Fulfillment Step Definition Name Scope Plan Step Assignment Method Select an Option --None-- Context Based Least Loaded Round Robin
--	--

4. You can also add rules if you select Context Based from the drop down
 - a. From the App Launcher, find and select Fulfillment Task Assignment Rules.

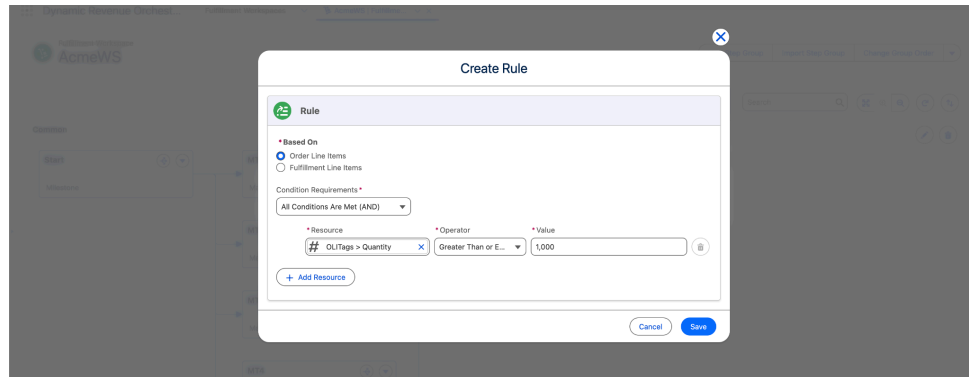

- b. Click New.
- c. Enter a unique name for the assignment rule.

- d. Select a source for the task assignment.
- e. Create a queue will few members
- f. Select User or Queue as the destination, and then search for and select the user or queue that you want to assign the task to.
- g. Enter a priority value for the rule to run.
- h. Select the step assignment method to be used when you assign the task to a user.
- i. Save your work.

- j. To save the rule and see the details pane for the rule, click Save.

- k. To save the rule and then define when the rule runs during fulfillment, click Save & Add Condition.
5. In the New Fulfillment Step Definition page, enter the appropriate information and save your work.

To automatically assign the task to a specific user, select the user from the Assigned To field. To assign the task to a person in a queue using task assignment rules, first assign the task to a queue, then select a step assignment method:

Assignment Rule	Process
Round Robin	Assigns the task to the next available person in the queue
Least Loaded	Assigns the task to the person with the fewest open task assignments
Context Based	Assigns the task to a person based on the specifications in the associated fulfillment task assignment rule. It can either be the next available person (Round Robin) or the person with the fewest open task assignments (Least Loaded).
