## Release Overview

This release brings significant advancements to the billing platform, introducing a multitude of features designed to enhance operational flexibility, customer satisfaction, and financial accuracy. By focusing on expanding core capabilities and introducing new advanced functionalities, this release addresses a wide range of business needs, enabling organizations to handle complex billing scenarios seamlessly.

One of the key highlights is the launch of the Advanced Billing Features Add-On, which empowers users with sophisticated tools such as Milestone Billing, Usage-Based Invoicing, Batch Invoice Document Generation, and Invoice Grouping. Additionally, financial processes are further streamlined with support for GL Account Management, Dual Transaction Journals, and Corporate Currency Capture.

In addition to these advanced features, the release introduces general enhancements that cater to diverse billing use cases:

- Bill Now for an Account for immediate invoicing.
- Suspend and Resume Billing for dynamic control over billing processes.
- Evergreen Amend, Renew, and Cancellation with mid-term adjustments and proration.
- Early Renewals with precise billing for overlap or new renewal periods.
- Ramp Deal Support for flexible handling of subscription contracts.
- Invoice Ingestion by API for seamless integration with external systems.

This comprehensive release ensures businesses are equipped to handle evolving customer requirements, complex financial processes, and operational scalability. By delivering greater control, flexibility, and automation, these updates empower organizations to achieve billing excellence and enhance customer experiences.

# Bill Now for Account or Order

## Business Objective

Businesses need the capability to generate consolidated invoices on-demand enabling them to bill a customer account or specific transactions instantly. This ensures timely invoicing, supports flexible billing needs, and improves both operational efficiency and customer satisfaction.

## Use Cases

- Generate an invoice immediately for a one-off customer transaction outside the regular billing cycle.
- Address urgent customer requests for immediate invoicing to facilitate faster payments.
- Provide flexibility for businesses operating in dynamic industries with irregular billing patterns.

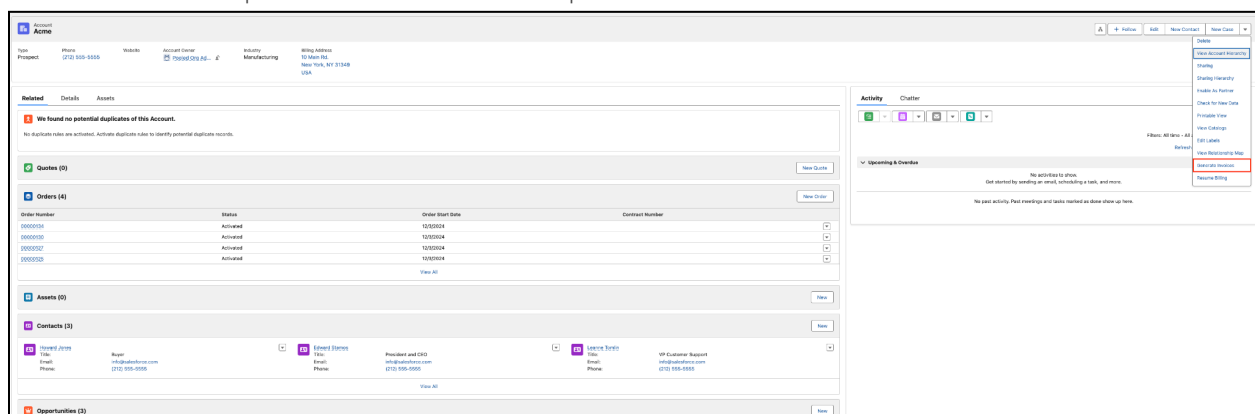

## Design Time Configuration

No design time configuration is needed. If the user has Billing Ops or Billing Customer Service Permission Sets, the user can generate invoices on demand.

## Configuration and Runtime Video

A new option to generate invoices has been introduced on the accounts page.

1. Open the Account record for which the invoice is to be generated on demand
2. On the dropdown menu for more options click on “Generate Invoices”

3. Select the Target Date, Invoice Date and Status for the Invoices Generated.

**Generate Invoices**

Generate invoices for all the billing schedules that are ready for invoicing and meet the criteria that you define.

\* Target Date

Dec 18, 2024

\* Invoice Date

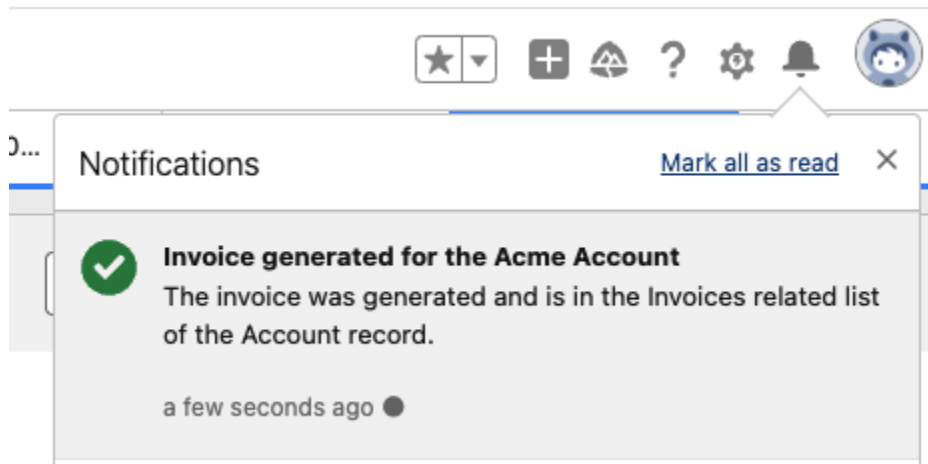

Dec 18, 2024

\* Status

Draft

**Generate**

4. Click on **Generate**
5. Users will be notified as soon as the process completes.

6.

Note: The Spring '25 release of Revenue Cloud Advanced and Revenue Cloud Billing supports up to 200 Billing Schedules in an Org. If the customer has more than 200 Billing Schedules, it is recommended to use Invoice Scheduler to generate the invoices.

[Bill Now Video \(Revenue Cloud Overview Presentation\)](#)

# Suspend & Resume Billing

## Business Objective

The "Suspend and Resume Billing" functionality allows businesses to temporarily pause invoicing for a customer account or asset to address invoicing errors, disputes, or payment challenges. This ensures billing accuracy, prevents further operational issues and billing process violations, and maintains customer trust while providing the flexibility to resume billing seamlessly once issues are resolved.

## Use Cases

- Temporarily suspend invoicing for a customer account due to billing disputes or service issues until resolved.
- Pause invoicing for Billing Schedule Groups when a customer requests a temporary hold on services.
- Suspend billing for customers facing financial difficulties, allowing them time to recover while maintaining goodwill.
- Resume invoicing seamlessly once disputes or errors are corrected or the customer's payment ability is restored.
- Prevent invoice generation for inactive accounts or assets until they are reactivated.
- Avoid revenue leakage by ensuring suspended accounts are flagged and monitored for timely reactivation.

Note: Suspension will not skip the billing for the suspended period. The Billing Schedule transactions will not be processed for invoice generation events until the suspension state is canceled and the next bill cycle is executed. Once billing has been resumed for the account, the bill for the entire suspended period will be generated in the next billing cycle.

## Design Time Configuration

There will be no design time needed. If the user has Billing Ops, Billing Customer Service or Billing Administrator Permissions, the user would be able to suspend and resume billing.

## Configuration and Runtime Video

A new option to generate invoices has been introduced on the accounts and Billing Schedule Group page.

1. Open the Account record that you want to Suspend or Resume billing for.
2. On the dropdown menu for more options click on “Suspend Billing”.

3. Suspension can be done immediately or in a future date by mentioning the suspension date. Similarly, the resumption date can be used to automatically resume the billing for the customer as soon as the resumption date is reached.

The screenshot shows a modal form titled 'Suspend Billing'. It has two input fields: '\* Suspension Date' and '\* Resumption Date'. The 'Suspension Date' field is set to 'Dec 18, 2024' and the 'Resumption Date' field is set to 'Dec 19, 2024'. Both fields have a calendar icon to the right. At the bottom right of the form is a blue button labeled 'Suspend'.

4. The user can resume the billing by clicking Resume Billing on the accounts page.

**Resume Billing**

☐ Cancel Suspension

\* Suspension Date: Jan 8, 2025

Resumption Date: Jan 22, 2025

**Resume**

5. We can either resume the billing on a future date or immediately resume by clicking on "Cancel Suspension".

### [Configuration and Runtime Video](#)

 [Suspend and Resume Billing Video \(Revenue Cloud Overview Presentation\)](#)

## Preview Invoices via API

### Business Objective

The Invoice Preview API provides businesses with a powerful tool to enhance transparency and decision-making during the billing process. By allowing representatives to pass a transaction ID and retrieve detailed invoice and invoice line data for the next two billing periods, this feature enables proactive insights into upcoming charges. It helps customers understand their future bills, supports sales teams in providing accurate cost estimates, and assists AR teams in addressing pre-billing inquiries or concerns. This capability not only improves customer satisfaction but also reduces billing disputes by fostering clarity and trust.

### Use Cases

- Retrieve detailed invoice and invoice line data for the next two billing periods to provide customers with a preview of upcoming charges.
- Enable sales representatives to share accurate cost estimates with customers during contract negotiations or upsell discussions.
- Help Sales team address pre-billing inquiries by giving customers a clear breakdown of future charges before invoices are generated.
- Provide account managers with insights into upcoming billing to prepare for customer discussions or renewal planning.
- Enhance customer satisfaction and trust by improving transparency in billing cycles and reducing surprises in invoices.
- Helps generate invoice preview from any transaction without creating the Invoice in the system.

### Design Time Configuration

No design time needed.

### Configuration and Runtime Video

- The Preview invoices API can be executed through a tool such as Postman
- HTTP Method: POST

- Endpoint:  
`/services/data/v63.0/commerce/invoicing/invoices/collection/actions/preview`
- Limitation in the Spring '25 Revenue Cloud Advanced release:
  - Does not handle ARC orders
  - Only supports up to 2 invoice previews
  - No support for Milestone Billed products
  - Bundled products are shown without product relationships
  - Preview API does not calculate overages for usage products
  - Supports preview of up to 200 Billing Schedules

API Request: Body:

# Invoice Scheduler

## Business Objective

The Enhanced Invoice Scheduler empowers businesses with advanced capabilities to streamline and automate their billing operations. By supporting multiple currencies, it enables seamless global invoicing for diverse customer bases. The addition of immediate invoice runs ensures flexibility to handle urgent billing needs, while the option to set scheduler end dates simplifies management by automatically deactivating schedules when no longer needed. Furthermore, the ability to edit draft and inactive invoice schedules provides greater control and reduces errors, ensuring accuracy and efficiency in invoice generation.

## Use Cases

- Schedule invoices in multiple currencies to cater to global customers seamlessly. This generates separate invoices for separate currencies.
- Perform an immediate invoice run to handle urgent billing requests or unplanned transactions.
- Set an end date for an invoice scheduler to automatically deactivate it when no longer required, reducing manual intervention.
- Edit draft invoice schedulers to correct errors or update billing parameters before activation.
- Modify inactive invoice schedules to adjust for changing customer needs or business requirements.
- Automate invoicing processes while maintaining flexibility for manual adjustments when needed.

## Design Time Configuration

No design Time needed.

## Configuration and Runtime Video

1. From the App Launcher, find and select Billing Batch Schedulers.
2. Click New Invoice Scheduler.
3. Enter a scheduler name.
4. To activate the invoice scheduler, select Active.

5. Invoices are generated only when the scheduler is active. You can create invoice schedulers and activate them when needed.
6. Click on Start Run Now to immediately start the scheduler and generate invoices.

**Schedule Invoice Run**

**Schedule Information**

\* Scheduler Name

☒ Start run now ⓘ ☒ Active

\* Target Date ⓘ Dec 18, 2024

\* Invoice Date ⓘ Dec 18, 2024

Next

7. If Start Run now is clicked, the only inputs needed are the Target Date and Invoice Date. Rest of the fields are deactivated.
8. To directly post invoices to the customers, select Post invoices. If you deselect Post invoices, draft invoices are created.
9. Select a frequency for creating a recurring invoice scheduler.

10. To generate invoices only once, select a target date and invoice date. This does not run immediately but runs on the specified start date and time provided.

The screenshot shows the 'Invoice Settings' section with the 'Frequency' set to 'Once'. Below this, there are two date pickers: 'Target Date' and 'Invoice Date', both set to 'Aug 23, 2024'. The format for both is 'MMM d, yyyy'.

11. To generate invoices on a daily basis, select a target date offset and invoice date offset.

The screenshot shows the 'Invoice Settings' section with the 'Frequency' set to 'Daily'. Below this, there are two text input fields for 'Target Date Offset' and 'Invoice Date Offset', both containing the value '0'.

12. To generate invoices on a weekly basis, select a day of the week, target date offset, and invoice date offset.

The screenshot shows the 'Invoice Settings' section with the 'Frequency' set to 'Weekly'. Below this, there is a 'Every' section with buttons for days of the week: 'Sun', 'Mon', 'Tue', 'Wed', 'Thu', 'Fri', and 'Sat'. The 'Target Date Offset' and 'Invoice Date Offset' fields both contain the value '0'.

13. To generate invoices on a monthly basis, specify the required date. You can also generate invoices based on a specific day of the month. Select the target date offset and invoice date offset. If your invoice generation start date falls on a holiday or weekend, you can schedule the invoice run for the next business day.

Invoice Settings

☐ Exclude holidays and weekends ⓘ

Here's how the invoice run inherits its target date and invoice date.

|                     |                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------|
| Target Date         | The invoices with the next billing date before this date are picked up for invoicing.             |
| Target Date Offset  | The number of days added to or subtracted from the next billing date to generate the target date. |
| Invoice Date        | The date on the invoice.                                                                          |
| Invoice Date Offset | The number of days added to or subtracted from the invoice date to generate the invoice date.     |

14. The user can select “Stop Scheduler Recurrence” to “On” and select the “End Date”

The screenshot shows the 'Schedule Invoice Run' dialog box. It is divided into two main sections: 'Schedule Information' and 'Invoice Settings'. In the 'Schedule Information' section, there are fields for 'Scheduler Name', 'Start Date', 'Start Time', 'Time Zone', and 'Post invoices'. In the 'Invoice Settings' section, there are options for 'Frequency' (Once, Daily, Weekly, Monthly), 'On' (Every), 'Cadence' (First), 'Day' (Monday), 'Target Date Offset', 'Invoice Date Offset', 'Exclude holidays and weekends', and 'Calculate invoice date from run date'. The 'Stop Scheduler Recurrence' section is highlighted with a red box, showing the 'On' radio button selected and an 'End Date' field. A 'Next' button is located at the bottom right of the dialog box.

15. Click Next.

16. Select the billing batch that the invoices are generated for.

17. A billing batch is a group of invoices processed together during a billing run. Billing batches organize and manage the invoicing process by grouping similar invoices, which can be sent out in bulk. The invoice run picks up the billing batches from the billing schedules.

18. Select the billing charge type for the invoice.

19. You can select one or both of these charge types: recurring and one-time. Additionally, you can filter the invoice based on the legal entity and customer.

20. Select the currencies that need to be billed.

21. Click Schedule.

Note: The total invoiced amount and total draft invoice amount can't be summarised for the invoice batch run if multiple currencies are processed.

# Evergreen Amend, Renew, Cancel Support

## Business Objective

The Evergreen Amend, Renew, and Cancel Support feature enhances flexibility and control over managing evergreen subscriptions. Sales representatives can now amend, renew, or cancel subscriptions at any time rather than being restricted to the next billing date. This ensures alignment with customer requests and business needs. The system accurately calculates billing adjustments, including partial period charges or proration based on configuration, and cancels relevant billing transactions seamlessly. This functionality improves operational efficiency, enhances customer satisfaction by accommodating mid-cycle changes, and ensures precise billing for all subscription amendments.

## Use Cases

- Enable Sales Reps to cancel subscriptions mid-cycle by selecting the associated asset, ensuring flexibility for customer requests.
- Automatically calculate the final amount to be billed during cancellations, accounting for partial period charges or proration settings.
- Support amendments to evergreen subscriptions at any time, such as upgrading or downgrading services mid-term.
- Provide functionality to renew evergreen subscriptions outside the regular billing cycle, aligning with customer preferences or business needs.
- Adjust billing schedules dynamically based on the amendment or cancellation date, ensuring accurate invoicing.
- Ensure seamless cancellation of billing transactions associated with a subscription when it is terminated.
- Support configurations to enable or disable partial period proration and accurately calculate values based on the selected option.
- Improve customer satisfaction by providing timely and accurate billing adjustments for mid-cycle changes.

## Design Time Configuration

No Design Time Configuration Needed

### Configuration and Runtime Video

No additional configuration is required for enabling this feature. The existing flows for asset amendment, renewal, and cancellation will continue to apply seamlessly. The system now enhances flexibility by removing restrictions on mid-term amendments, renewals, or cancellations for evergreen products.

Billing operations will automatically generate accurate invoices or adjustments based on the selected proration policy and the specific action performed, ensuring precise billing and alignment with customer requests. This improvement simplifies operations while maintaining billing accuracy and efficiency.

### Configuration and Runtime Video

 [Evergreen Billing Support Video \(Revenue Cloud Overview Presentation\)](#)

# Update Billing Parameters

## Business Objective

The Update Billing Parameters for Ongoing Transactions feature provides Billing Operations teams with enhanced control and flexibility to manage active billing schedules and transactions. With the addition of a new permission in the Billing Ops permission set, users can now update key billing parameters such as Billing Day of Month, Override Next Billing Date, Payment Terms, Billing Treatment, and Billing Address. This capability ensures that billing adjustments can be made in real-time to accommodate customer requests, resolve errors, or align with evolving business requirements, improving operational efficiency and customer satisfaction while minimizing disruptions to the billing cycle.

## Use Cases

- Allow Billing Ops users to update the **Billing Day of Month (BDOM)** for an active transaction to accommodate customer requests for preferred billing dates.
- Enable Billing Ops users to set an **Override Next Billing Date (ONBD)** for a one-time adjustment in the billing cycle, ensuring flexibility in managing unique scenarios.
- Provide in-line editing capabilities for Billing Ops to quickly update billing parameters directly on the selected Billing Schedule Group (BSG).
- Automatically adjust the next billing date based on the **ONBD** value while ensuring subsequent cycles align with the updated **BDOM**.
- Ensure seamless billing transitions for customers by applying updated parameters without disrupting the overall billing schedule.
- Support real-time updates to billing parameters, ensuring immediate reflection of changes in the system.
- Maintain accurate and consistent billing schedules for subscriptions by updating parameters dynamically based on customer requirements.
- Prevent billing errors or inconsistencies by validating and applying changes to billing parameters only within the defined rules and system logic.

## Design Time Configuration

This feature is only available on the Revenue Cloud Billing Product. A separate set of licensing is required to utilize this functionality.

## Configuration and Runtime Video

1. From the App Launcher, find and select Billing Schedule Groups.
2. From the List Page, Perform Inline Edits to update multiple BSGs from the same screen

# Invoice Ingestion and Creation

## Business Objective

Customers need an ability to create a standalone Invoice for various reasons like

- Bring in an externally generated invoice
- Create a new Invoice without billing schedule and billing schedule group
- Generate a one time Invoice

Hence they need an easy way to insert an Invoice into our billing system or create a new one

## Use Cases

- Customers have been using a different billing system and now want to migrate to Revenue Cloud Billing
- Customers want to create a one time Invoice
- Customers want to create an Invoice without Billing Schedule and Billing Schedule group as they do not have any subscription model

## Design Time Configuration

Revenue Cloud Advanced makes use of the Data Cloud [Invoice Ingestion API](#) to ingest invoices from other systems into the Salesforce environment. Please reference the Ingestion API documentation for more information on use of this functionality.

## Configuration and Runtime Video

# Early Renewals Support

## Business Objective

The **Early Renewal Support** feature allows businesses to handle customer requests for renewing subscriptions before their scheduled renewal date. This ensures flexibility for customers who wish to secure continued service or take advantage of early renewal offers. The system accurately adjusts billing to account for the overlap period or the new renewal period, ensuring customers are charged correctly while maintaining seamless subscription continuity. This feature not only enhances customer satisfaction by accommodating their renewal preferences but also supports businesses in improving retention rates and cash flow predictability.

## Use Cases

- Allow customers to renew their subscriptions before the scheduled renewal date, ensuring uninterrupted service and bill the right amounts based on new renewal period
- Adjust billing calculations to account for any overlap between the current subscription period and the early renewal period.
- Generate invoices that accurately reflect charges for the new subscription term starting from the early renewal date.
- Provide flexibility for customers to renew early due to budgetary considerations or promotional offers.
- Enable Billing Ops to manage early renewals seamlessly by automatically updating the renewal and billing schedules.
- Perform an early renewal of the product

Set Renewal Term

☐ Renew based on default term start date ⓘ

\*Renewal Term Start Date: Apr 15, 2025

Renewal Term End Date: Dec 22, 2025

⚠ Selecting a start and end date overrides the current subscription renewal term and creates either a quote or order to refund the unused portion of the subscription.

Submit

- System creates an early renewal order
- Once order is activated system creates a new billing schedule against the same BSG( Asset) for the net new renewal period and creates a negative billing schedule for the overlap period of earlier schedule

# Ramp Deal Support

## Business Objective

Sales representatives can leverage ramp deals to address their customers' changing needs over time within a single transaction. By offering greater flexibility in pricing strategies, they can foster long-term customer relationships and drive business growth with predictable profitability. Once a ramp deal is executed/established customers should be billed appropriately / right amount for each of the ramped segments . Billing will be able to calculate the right amount per segment and generate the right Invoices

## Use Cases

- Allow customers to purchase products/services as ramped deals
- Bill customers the right amount based on the segment and prices negotiated for the segment

## Design Time Configuration

No design time configuration from billing side

1. Configure a product as rampable product and create an Order with the the product
2. Upon Order activation, the system creates one Billing Schedule Group for the Order Product and one Billing Schedule for each of the segments defined in the Ramp Deal

## Related Asset on Billing Schedule Group

### Business Objective

The Related Asset on BSG feature enhances billing accuracy and traceability by stamping the associated asset directly onto the Billing Schedule Group (BSG). This linkage provides a clear reference between billing schedules and the underlying assets, simplifying the management of asset-based billing. By establishing this connection, businesses can ensure invoices are accurately tied to specific assets, reducing errors and improving operational efficiency in subscription or usage-based billing scenarios.

### Use Cases

- Stamp the associated asset on the Billing Schedule Group (BSG) to maintain a clear link between the asset and its billing schedule.
- Enable AR teams to quickly trace invoices back to the underlying asset for dispute resolution or audit purposes.
- Simplify reporting and analysis by linking assets to their corresponding billing schedules groups for better tracking and insights.

### Design Time Configuration

No Design Time or Configuration is needed. This is an automated stamping process. The underlying Asset is referred to as the Reference Entity and is associated with the Reference Entity field on the Billing Schedule Group page layout.

# Corporate Currency

## Business Objective

Additional attributes that capture the snapshot of corporate currency equivalents for billing transactions which have non-corporate currency as isocode, to be used for calculating Foreign Exchange Gain & Loss.

## Use Cases

- Capture the Corporate currency equivalents on billing transactions that are having a non-corporate currency
- Capture the snapshot of the exchange rate, date and corporate currency equivalent for the transaction total

## Design Time Configuration

- Admin has to setup Advanced Currency Management and ensure there is a process to mention the exchange rates
- Turn on **Store Transaction Amounts in Corporate Currency** under Billing Settings
- Ensure the Corporate Currency Fields are showing up on page-layouts for the accounts receivable transactions

[This article in the Salesforce Help](#) portal describes functionality to manage Multiple Currencies in your Org

Revenue Cloud Billing natively supports multi-currency functionality, ensuring invoices are generated in the same currency as the associated price book entry during order creation. The system automatically carries the currency ISO code and amounts from the order to the invoice, eliminating the need for additional configuration. This allows businesses to operate seamlessly across multiple geographies while maintaining accurate financial records in different currencies

## New Billing APIs (8)

### Business Objective

The introduction of 8 new Billing APIs provides businesses with enhanced capabilities to streamline invoicing operations, improve customer satisfaction, and adapt to diverse billing scenarios. From immediate invoice generation and billing control to seamless integration with external systems, these APIs deliver flexibility and accuracy. They enable businesses to automate key processes, recover from errors efficiently, and provide dynamic adjustments to meet customer and operational requirements, ensuring a more agile and reliable billing experience.

### Use Cases

- Generate invoices immediately for specific accounts using the "Bill Now" functionality via the **Create Invoices Using Billing Schedules API**.
- Temporarily halt or resume billing for accounts or Billing Schedule Groups (BSGs) using the **Suspend Billing API** and **Resume Billing API**.
- Retrieve detailed previews of upcoming invoices for billing transactions with the **Preview Invoices API**, enhancing transparency for customers.
- Import invoices from external systems using the **Ingest Invoices** from an External System API to support unified billing management.
- Create invoice documents in bulk for large invoice runs using the **Batch Invoice Doc Generation API** and Invokable Action, reducing manual effort.
- Retry failed document generation efficiently with the **Retry Invoice Doc Generation API**, ensuring consistency in invoice documentation.
- Dynamically adjust invoice scheduling parameters through the **Edit Invoice Scheduler API** to accommodate changes in customer or business needs.

### Design Time Configuration

No Design Time

### Configuration and Runtime Video

There are 8 new APIs that have been introduced:

- Create Invoices By Using Billing Schedules API - Bill Now for Account
- Suspend billing API for accounts and billing schedule groups

- Resume billing API for accounts and billing schedule groups
- Preview invoices for a billing transaction API
- Ingest invoices from an external system API
- Batch Invoice Doc Generation API and Invokable Action
- Retry Invoice Doc Generation API
- Edit Invoice Scheduler API
