Release Overview

This release delivers a robust suite of enhancements to the billing platform, empowering finance and operations teams with deeper visibility, automation, and scale. From improved tax handling to powerful credit tools and scalable billing capabilities, this update streamlines complex processes while ensuring compliance and control.

Central to this release is the enhanced Billing Central Dashboard, Billing App with Account 360, and the Billing Operations Console—offering a unified view of all billing activities and accelerating issue resolution. Teams can now manage billing schedules, profiles, and transaction flows with greater ease.

Financial accuracy is further supported by the ability to capture corporate currency equivalents for payments and refunds.

Tax compliance is strengthened through origin-based taxation, product-level exemptions, and the ability to credit taxes using original invoice dates. Teams can also import or create tax lines to support complex scenarios.

With features like billing schedule group visualization, billing profiles, and large-volume billing transaction support, this release ensures operational readiness for growth and high-performance billing at scale.

Billing App and Account 360

Business Objective

Businesses need a unified workspace to manage and act on all billing-related activities efficiently. The Billing App brings together all billing-specific tabs under one umbrella, making it easier for Billing Ops teams to navigate and manage billing processes.

As part of the Billing App, the Account tab provides a holistic view of a customer's billing information—such as account balances, ageing invoices, billing profiles, saved payment methods, and recent transactions. This enables Billing Ops users to quickly respond to inquiries, perform billing actions on demand, and proactively flag collection risks—ultimately reducing resolution times and improving cash flow visibility.

Use Cases

- View consolidated billing information for a customer account in a single tab, reducing the need to navigate across multiple screens.
- Track account balance and ageing invoices to assess payment risks and prioritize collection efforts.
- Access billing profiles to understand how the customer is billed (frequency, method, etc.).
- View saved payment methods (available only in Revenue Cloud Billing) to assist in payment-related inquiries.
- Perform standard billing actions on demand—such as generating invoices or credit memos directly from the account.
- Leverage the timeline component to review recent billing activities, transactions, and engagement history.
- Resolve billing-related inquiries faster by having all relevant information in one place during customer interactions.
- Support compliance and audit readiness with traceability of past billing events and actions.
- Enable collaboration across billing, collections, and customer service teams with a shared, real-time view of account billing data.

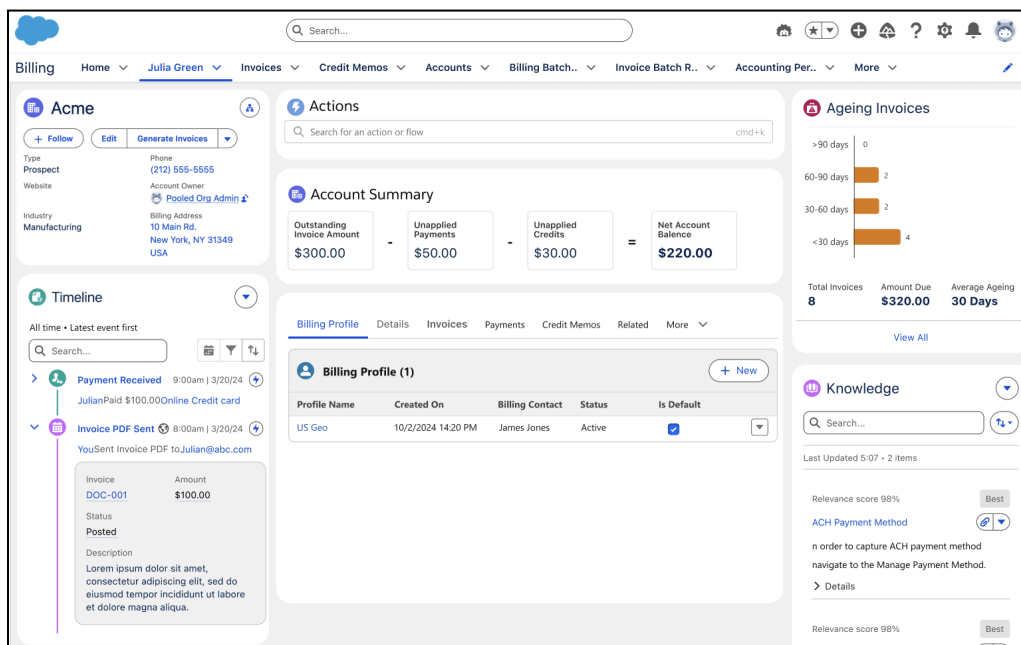

Design Time Configuration

No additional design-time configuration is required.

To ensure full functionality of Account 360, make sure the Timeline feature is enabled.
If it's not already active, navigate to:

Setup > Timeline, and **enable** the setting.

Configuration and Runtime Video

[Billing App and Account 360](#)

Billing Operations Console

Business Objective

Billing operations teams need a centralized console to monitor daily billing activities, track invoice run health, and swiftly address exceptions. The Billing Ops Console, accessible via the Billing App Home tab, delivers real-time insights and anomaly detection, enabling proactive management of billing processes to ensure timely and accurate invoice execution, reduce manual interventions, and enhance operational efficiency.

Use Cases

- Monitor daily invoice run summaries to track billing progress and completion status.
- View upcoming billing schedules to plan resources and prevent delays.
- Identify and drill into invoice exceptions and failures for rapid root cause analysis.
- Take corrective actions directly from the console to resolve billing issues quickly.
- Gain real-time visibility into invoice health and operational metrics to maintain billing accuracy.
- Reduce manual effort by automating exception detection and status tracking.
- Enable proactive issue management to minimize billing disruptions and revenue impact.
- Provide a single pane of glass for billing operations teams to collaborate effectively.

Design Time Configuration

No design Time Needed. This comes out of the box.

Configuration and Runtime Video

[Billing Ops Console Demo](#)

Create Standalone Credit Memo

Business Objective

Credit Operations teams need a fast and user-friendly way to create standalone credit memos for customer appeasements or adjustments. Enabling quick credit memo creation directly from the Credit Memo list or Account 360 page helps ensure timely credit processing, improves the customer experience, and streamlines internal operations by automatically applying credits in the next invoice.

Use Cases

- Create a standalone credit memo for a customer without linking it to a specific invoice or line item.
- Launch credit memo creation directly from the Credit Memo list view or Account 360 page.
- Enter credit details and post the memo for the credit to be applied in the next billing cycle.
- Support appeasements or service-level adjustments efficiently without delays.
- Reduce dependency on invoice-level edits for minor or one-off credits.

Design Time Configuration

No Design Time Needed. Comes out of the box.

Configuration and Runtime Video

1. From the App Launcher, find and select Credit Memos.
2. Click Create Credit Memo.

The screenshot shows the 'Create Credit Memo' form. The 'General Details' section has 'Account Name' set to 'University of California Berkeley', 'Status' set to 'Posted', 'Effective Credit Date' set to 'Apr 4, 2025', 'Tax Strategy' set to 'Manual Override', 'Tax Treatment' set to 'Select a Tax Treatment...', and 'Tax Effective Date' set to 'Select a date...'. The 'Credit Amount Details' section has 'Product ID' set to 'Laptop', 'Credit Amount' set to '100.00', 'Manual Override Tax Amount' set to '5.00', 'Product Name' set to 'Laptop', and 'Currency ISO Code' set to 'USD - U.S. Dollar'. The 'Shipping and Billing Information' section has 'Billing Address' and 'Shipping Address' both set to 'UCB' for the 'Street' field, with 'City' and 'State/Province' fields empty. The form has 'Cancel' and 'Create' buttons at the bottom right.

3. Enter an account name.
The credit memo status is set to posted and can't be modified.
4. Enter the credit memo effective date.

5. Select a tax strategy to define your tax calculation approach.

Ignore	Skips the creation of tax lines.
--------	----------------------------------

Manual Override	Uses the tax amount specified in the Manual Override Tax Amount field.
-----------------	--

Calculate	Computes tax lines by using the tax treatment ID.
-----------	---

6. If your tax strategy is Calculate, select a tax treatment.
7. If needed, provide a description for the credit memo.

8. Select the product ID that you want to associate with the credit. Enter the product name if the product isn't in your Salesforce org.
Either a product ID or product name is required to create a credit memo.
9. Enter the credit amount.
10. If your tax strategy is Manual Override, enter a manual override tax amount.
11. Select the currency of your credit amount.
12. If needed, enter the billing and shipping address.
- 13.** Click Create.

 [Standalone Credit Memo](#)

Create Credit Memo for Invoice Line

Business Objective

Credit Operations teams need the ability to efficiently create credit memos against specific invoice lines to address partial billing adjustments or disputes. Enabling credit creation and application directly from the invoice—by selecting one or more lines—streamlines the credit process, improves user efficiency, and enhances customer satisfaction through faster resolution.

Use Cases

- Launch the credit memo process directly from an invoice record in the Billing App.
- Select one or more invoice lines that require a credit adjustment.
- Quickly create and apply a credit memo with just a few clicks—no need for manual entry or offline calculation.
- Support partial credits, pricing errors, or product/service issues with precise, line-level adjustments.
- Ensure applied credits are accurately reflected in billing and reporting.
- Enhance Credit Ops productivity with an intuitive and guided credit creation flow.

Design Time Configuration

No design time needed.

Configuration and Runtime Video

1. From the App Launcher, find and select Invoices.
2. Open a posted invoice that the invoice lines belong to.
3. Go to the invoice related list.
4. From the invoice lines section, click View All.
5. On the invoice lines page, select one or more invoice lines that you want to apply the credit memo to.

6. Click Create and Apply Credit Memo.

The screenshot shows the 'Invoice Lines' section of the Salesforce Revenue Cloud interface. A modal dialog titled 'Create and Apply Credit Memo' is open, displaying a table with columns: Product, Line Amount, Line Charge Amount, Line Tax Amount, Invoice Line Balance, Credit Amount, Enable tax calculation, Credit Tax Amount, and Total Credit Amount. Two lines are shown, both for 'Google Workspace'.

Product	Line Amount	Line Charge Amount	Line Tax Amount	Invoice Line Balance	Credit Amount	Enable tax calculation	Credit Tax Amount	Total Credit Amount
1 Google Workspace	USD 27.50	USD 25.00	USD 2.50	USD 27.50	USD 10.00	☐	USD 4.00	USD 14.00
2 Google Workspace	USD 27.50	USD 25.00	USD 2.50	USD 27.50	USD 15.00	☐	USD 3.00	USD 18.00

Buttons: Cancel, Create and Apply

7. For each invoice line, enter the credit amount that you want to apply.
8. The credit amount must be zero or greater and must not exceed the invoice line balance.
9. Define the tax calculation strategy.
10. Deselect enable tax calculation Compute tax lines by using the API.
11. Select enable tax calculation Use the amount in the Credit Tax Amount field instead of automatic tax line calculation. If the Credit Tax Amount field is blank, ignore the tax lines.
12. Click Create and Apply.

Billing Schedule Group Visualization

Business Objective

Billing Operations teams need a clear and consolidated view of all transactions associated with a Billing Schedule Group (BSG), including its relationships with other BSGs, to manage billing activities effectively. The BSG Visualization provides a single, intuitive interface where users can see all related billing schedules—as well as parent-child BSG relationships. This improves visibility, reduces navigation effort, and helps users understand billing structures and dependencies at a glance.

Use Cases

- Access a BSG record to view all related transactions in one place, including invoice lines, credit memos, and billing schedules.
- Visualize parent-child relationships between BSGs to understand how related billing groups are structured and connected.
- Improve decision-making and operational response by understanding the dependencies between related BSGs.
- Reduce navigation overhead and provide a clearer view of complex billing scenarios through visual relationship mapping.

Design Time Configuration

No Design Time Needed

Configuration and Runtime Video

1. Visit a BSG and click on the “Billing Schedules” tab to see the visualization.

The screenshot displays the Salesforce Billing Schedule Group Visualization interface. The main section shows the 'Billing Schedules' tab for a specific BSG (BSG-000000002). The table lists the following data:

Name	Category	Quantity	Total Amount	Billed Am...	Billing Period Amount	Pending Amount	Next Billing Date	Status	Billing Schedule...	Billing Schedule End...
1 BSG-000000002	Original	1.00	USD 240.00		USD 20.00	USD 240.00	1/1/2025	Ready for Invoicing	1/1/2025	12/31/2025

On the right, the 'Relationships' panel shows a visual mapping of parent-child BSG relationships, with a search bar and a list of associated groups.

[Billing Schedule Group - Billing Schedule Visualization](#)

Billing Profile

Business Objective

Billing Operations teams need the ability to configure and manage billing preferences at the account level to support customer-specific invoicing needs. The Billing Profile feature enables creation of one or more billing profiles per account—each with unique configurations such as billing address, payment terms, Bill Day of Month (BDOM), and Bill-to Contact. This ensures billing is executed accurately based on customer preferences, supports complex billing scenarios, and improves operational flexibility and customer satisfaction.

Use Cases

- Create one or more billing profiles against a customer account to reflect different billing preferences for various scenarios (e.g., business units, locations, departments).
- Set a default billing profile that will be applied automatically when no profile is specified during transaction processing.
- Specify billing configurations such as BDOM, payment terms, billing address, and Bill-to Contact per profile.
- Pass a specific billing profile when creating or processing a transaction to override the default settings.
- Ensure transactions are billed correctly and consistently in alignment with customer agreements.
- Support multiple business models or customer hierarchies by allowing profile-level billing variation under the same account.
- Improve billing accuracy and reduce manual corrections by capturing preferences upfront.

Design Time Configuration

1. From the App Launcher, find and select Billing.
2. From the navigation bar, click Accounts.
3. Open the account that you want to create a billing profile for.

4. In the Billing Profile section, click New.

5. Verify the account name.
6. Create a billing account.
 - Click the Billing Account field.
7. Click New Billing Account.

- Enter a name for the billing account.

- Enter the primary billing address.
 - Enter the shipping address.
 - Enter the bill day of month.
 - Select a bill to contact.
 - Select the payment terms.
8. Save the billing account.

9. To make this the default billing profile, select Default Billing Account.
You can set only one default billing profile for an account.
10. Save the account billing account.
When billing processes a transaction or order, it first checks for fields such as payment terms and billing address provided in the transaction.

- If these fields are present, billing uses them.
- If they are missing and the transaction is associated with a billing account, billing uses the fields from that account.
- If the transaction has no fields and isn't associated with a billing profile, billing uses the account's default billing profile.

Configuration and Runtime Video

 [Billing Profile Creation](#)

Capture Corporate Currency Equivalents of Payment & Refund

Business Objective

Additional attributes that capture the snapshot of corporate currency equivalents for billing transactions which have non-corporate currency as isocode, to be used for calculating Foreign Exchange Gain & Loss.

Use Cases

- Capture the Corporate currency equivalents on billing transactions that are having a non-corporate currency
- Capture the snapshot of the exchange rate, date and corporate currency equivalent for the transaction total

Design Time Configuration

- Admin has to setup Advanced Currency Management and ensure there is a process to mention the exchange rates
- Turn on Store Transaction Amounts in Corporate Currency under Billing Settings
- Ensure the Corporate Currency Fields are showing up on page-layouts for the accounts receivable transactions (Payment and Refund)

Configuration and Runtime Video

[Capture Corporate Currency Equivalents for Payments and Refunds](#)

Support Origin Based Taxation

Business Objective

To ensure tax compliance and accurate tax calculations for states that mandate origin-based taxation, the billing system must support capturing and transmitting the Ship From address along with the Ship To and Bill To addresses. This capability enables companies to comply with regional tax laws, particularly in U.S. states that calculate sales tax based on the point of origin of the goods or services. By introducing Ship From address support at the Billing Schedule Group (BSG), Invoice Line, and Credit Memo Line levels, businesses can now accurately determine applicable tax rates and reduce risk related to tax miscalculation or audit failure.

Use Cases

Compliant Tax Calculation for Origin-Based States

- A customer in **California** receives a shipment from a warehouse in **San Francisco**. The tax is calculated based on the **Ship From** address, as required by CA origin-based tax rules.

Override Default Ship From with BSG Address

- For a complex project, a company uses a different fulfillment center for a specific Billing Schedule Group. The system uses the **overridden BSG Ship From address** for correct taxation.

Automatic Fallback to Legal Entity Address

- If no Ship From address is defined, the system uses the **Legal Entity's address** as the default source location for tax calculation, maintaining data integrity without configuration gaps.

Support for Multi-State Tax Compliance

- A business ships from multiple states like **Arizona, Missouri, Ohio, and Utah**. The updated billing system ensures the correct Ship From address is used per transaction to satisfy local tax compliance.

Design Time Configuration

- When creating a Billing Schedule Group, ensure the ShipFrom Address is mapped in the Billing context for the shipFrom address attributes, else the Legal entity address would be used as default.

Configuration and Runtime Video

[Support Origin Based Taxation](#)

Support Product Level Exemptions

Business Objective

To ensure accurate tax calculation and regulatory compliance, the billing system must support product-level tax exemptions. By identifying tax-exempt products based on their SKU (Stock Keeping Unit), the system can automatically apply correct exemptions during tax computation on invoice lines. This functionality enables businesses to minimize tax liabilities on exempt products such as prescription drugs, medical devices, or charitable goods, and align with regional tax laws and policies.

Use Cases

Automatic Tax Exemption for Eligible Products

- A product such as a **prescription drug** is tax-exempt in many jurisdictions. When the SKU "**PRES-RX-12896745**" is included in an invoice line, the system automatically marks the tax exempt amount, reducing total tax dues.

Health Care and Nonprofit Sectors

- Companies selling to hospitals or charities benefit from **automated exemption recognition**, eliminating manual tax override and ensuring compliance.

Deriving Exemption from Product Catalog

- The tax contract dynamically pulls the SKU from the **Product table**, using the product info in the **order-product-to-billing schedule pipeline**, avoiding redundant configurations or errors.

Reduce Manual Intervention for Tax Adjustments

- Tax exemption logic is baked into the billing workflow, reducing effort for finance teams and minimizing errors in downstream tax reporting.

Design Time Configuration

- Ensure every product has a product code in the system which can be identified by the tax system
- Setup the tax exempt certificates for the product on the Tax Vendor application

Configuration and Runtime Video

[Product Level Exemptions \(0:52 in the video\)](#)

Credit Taxes Based on Original Invoice Date

Business Objective

Ensure tax compliance and accuracy by applying the same tax rate used on the original invoice when issuing a credit. This prevents discrepancies due to tax rate changes over time and aligns with standard accounting and tax reporting practices.

Use Cases

- Use the same tax rate as applied during original invoicing while issuing full or partial credits.
- Ensure tax rate consistency even if the tax rate has changed between the invoice date and credit issuance.
- Support tax audit readiness by maintaining traceable and reversible tax records tied to the original transaction.
- Comply with jurisdictions where tax reversals must match the original tax application.

Design Time Configuration

None

Configuration and Runtime Video

[Tax Features](#)

RunTime Experience

1. Create an Order with a subscription product with an Advance type treatment
2. Activate the Order to generate Billing Schedules
3. Generate and post the invoice with a specific invoice date
4. Try amending the Order related to the above invoice - Try cancelling it (probably few days / months passed after the above invoice date) - Activate the Order - Billing Schedules with negative lines would be created
5. Generate and post the invoice for the above schedules.
6. Notice the creation of an invoice with negative lines
 - a. Check the tax request for the negative lines, it would be a credit call with the reference to the original invoice document and the original invoice date as effective date

Import or Create Tax Lines

Business Objective

Provide the flexibility to customers to use their system of choice when it comes to calculating taxes beyond the existing options we provide with tax interface and partnerships with Tax Vendors.

Use Cases

Leverage an external system or process/object of choice to calculate taxes and bring them back into the billing system

Design Time Configuration

Ensure the Billing Admin permissions are provided to the user integrating the external system, for the InvoiceLineTax entity

Configuration and Runtime Video

 [Import Tax Lines](#)

Runtime Options

Customers can leverage the data integration tools like DataLoader, etc. which can be used to insert/upsert the InvoiceLineTax records.

Large Volume Billing Transaction Support

Business Objective

As billing volumes grow with large enterprise transactions and complex product bundles, businesses require scalable APIs to handle high transaction throughput efficiently. By increasing the API processing limits for billing transactions and tax calculations, Revenue Cloud supports high-volume use cases—such as order-based billing and large invoice generation—without performance degradation. This ensures scalability, faster processing, and seamless integration with upstream order systems.

Use Cases

- **Bulk Billing Schedule Creation from Orders**
 - Create up to 1,000 billing schedules in a single API call from order lines.
 - Ideal for scenarios where large B2B or usage-based contracts need to be billed quickly.
- **High-Volume Tax Calculation**
 - Calculate taxes for up to 2,000 invoice lines in a single synchronous API request.
 - Useful for batch invoicing processes where each invoice may have hundreds of line items.
- **Enterprise-Scale Billing Automation**
 - Automate billing for enterprise orders with thousands of line items by leveraging the updated API limits.
 - Supports order-to-cash automation in systems that generate thousands of transactions in a single customer event.
- **Upstream Order Integration (e.g., RCA or CPQ Orders)**
 - Seamlessly handle order ingestion into the billing engine by processing up to 1,000 order lines as billing transactions.
- **Partner Tax App Integration**
 - Allows tax partners (via AppExchange) to implement graceful error-handling beyond their supported limits (~700 lines), ensuring robust interoperability with large billing payloads.

Design Time Configuration

No design Time needed.

Configuration and Runtime Video

Description	Previous	Current	Comments
The number of billing transaction items that can be processed by the Create Billing Schedules From Billing Transactions API	200	1000	Order to Billing Schedule (Support upto 1000 order lines to be created as billing schedules)
The number of lines supported by Calculate Tax API Interface (Sync) Tax Calculation (POST)	200	2000	Request can have 2000 lines. <i>Tax Vendors will update their AppExchange to graciously error out beyond the limits they support (~700).</i>

Scalability	• Invoice batch run can support generating invoices with 2000 invoice lines • Recovery Invoice Batch Run also supports 2000 lines • DRAFT to POSTED for entire IBR also supported for invoices with 2000 lines
Reliability	• Intuitive Status Tracking - Enhanced IBR with sub-statuses making the process more transparent to the billing operations users while monitoring jobs
	• Cleanup - Delete associated RTEs from an IBR on Invoice Recovery Run or Recovery API

Limitations:

- Voiding an invoice with 2000 lines is not supported
- Voiding an entire Invoice Batch Run is not supported

[Configuration and Runtime Video](#)

 [Scale and Performance](#)

Billing Central Dashboard

Note -

In order to use this feature, your Org must be provisioned with Data Cloud licenses. In the Revenue Cloud Enablement Orgs, Data Cloud is provisioned on an individual case basis by requesting the assignment and activation of Data Cloud, Einstein, and Agentforce licenses. Please use [this link](#) to submit a request to provision those required licenses to complete the following exercises. You will be notified when the licensing in your training Org has been updated.

Business Objective

Businesses need a centralized and intelligent view of billing performance and invoice operations to proactively manage billing health and ensure smooth billing cycles. The Billing Central Dashboard, part of the Revenue Management Intelligence SKU and powered by Tableau and Einstein, delivers real-time insights into key billing metrics and invoice statuses. Integrated with Data Cloud, it empowers billing teams to identify anomalies, take timely action, and reduce revenue leakage—enhancing operational efficiency, billing accuracy, and customer satisfaction.

Use Cases

- Monitor overall billing health with real-time visibility into billing volume, success rate, failures, and exception trends.
- Track invoice generation performance, including success/failure rates across invoice runs, to identify and resolve issues proactively.
- Drill into failed invoice records to analyze root causes and take corrective action without leaving the dashboard.
- Identify revenue leakage caused by missed or failed invoices and take timely action to recover lost revenue.

- Empower billing operations teams with actionable insights to streamline daily processes and reduce manual effort.
- Enhance audit readiness by providing transparent logs and traceability of invoice processing over time.
- Support operational KPIs by tracking invoice run duration, throughput, and exception clearance time.
- Enable collaboration across teams (finance, operations, IT) by using a single source of truth powered by Tableau visualizations.
- Facilitate executive reporting with summarized billing health metrics and trends for leadership decision-making.

Design Time Configuration

Rev Analytics Docs

This document speaks about the complete Installation Steps for Billing Apps.

Configuration and Runtime Video

1. Once installed, the Billing Central Dashboard will be accessible as a new option in the Billing App dropdown menu.
2. On the Account Page, two new widgets will be available:
 - a. Account Summary:
 - i. Provides a snapshot of the customer's current financial status.
 - ii. Displays total charges, payments received, and outstanding balances.
 - b. Overdue Invoices:
 - i. Lists all overdue invoices linked to the account.
 - ii. Shows the due amounts and helps prioritize follow-up actions.

Configuration and Runtime Video
