Release Overview

This release introduces a powerful set of enhancements to the billing platform, designed to deliver greater control, scalability, and a seamless user experience. With new interfaces, APIs, and automation tools, finance and operations teams can now manage billing, invoicing, taxation, payments, and collections with increased agility and accuracy.

At the heart of this release is the new **Billing Operations Console** and **Billing App with Account 360**, providing centralized visibility and control over all billing processes. Teams can easily track schedules, resolve issues, and take action faster than ever.

Invoice and credit workflows have been simplified with tools like **Preview Invoice UI**, **Enhanced Document Templates**, and **Write Off Invoices API**. Flexible credit handling through **Standalone Credit Memos** and **Line-Level Adjustments** ensures accurate reconciliation.

Tax capabilities are strengthened with **Origin-Based Taxation**, **Product-Level Exemptions**, and **Backdated Tax Credits**, while accounting features like **GL Assignment Rules** and **Corporate Currency Capture** ensure financial compliance and reporting integrity.

With expanded **payment infrastructure**, including **Guided Setup**, **Saved Payment Methods**, and **Scheduled Batch Payments**, and fully integrated **collections tools**, this release positions businesses to scale efficiently and deliver exceptional billing experiences.

Billing App and Account 360

Business Objective

Businesses need a unified workspace to manage and act on all billing-related activities efficiently. The Billing App brings together all billing-specific tabs under one umbrella, making it easier for Billing Ops teams to navigate and manage billing processes.

As part of the Billing App, the Account tab provides a holistic view of a customer's billing information—such as account balances, ageing invoices, billing profiles, saved payment methods, and recent transactions. This enables Billing Ops users to quickly respond to inquiries, perform billing actions on demand, and proactively flag collection risks—ultimately reducing resolution times and improving cash flow visibility.

Use Cases

- View consolidated billing information for a customer account in a single tab, reducing the need to navigate across multiple screens.
- Track account balance and ageing invoices to assess payment risks and prioritize collection efforts.
- Access billing profiles to understand how the customer is billed (frequency, method, etc.).
- View saved payment methods (available only in Revenue Cloud Billing) to assist in payment-related inquiries.
- Perform standard billing actions on demand—such as generating invoices or credit memos directly from the account.
- Leverage the timeline component to review recent billing activities, transactions, and engagement history.
- Resolve billing-related inquiries faster by having all relevant information in one place during customer interactions.
- Support compliance and audit readiness with traceability of past billing events and actions.
- Enable collaboration across billing, collections, and customer service teams with a shared, real-time view of account billing data.

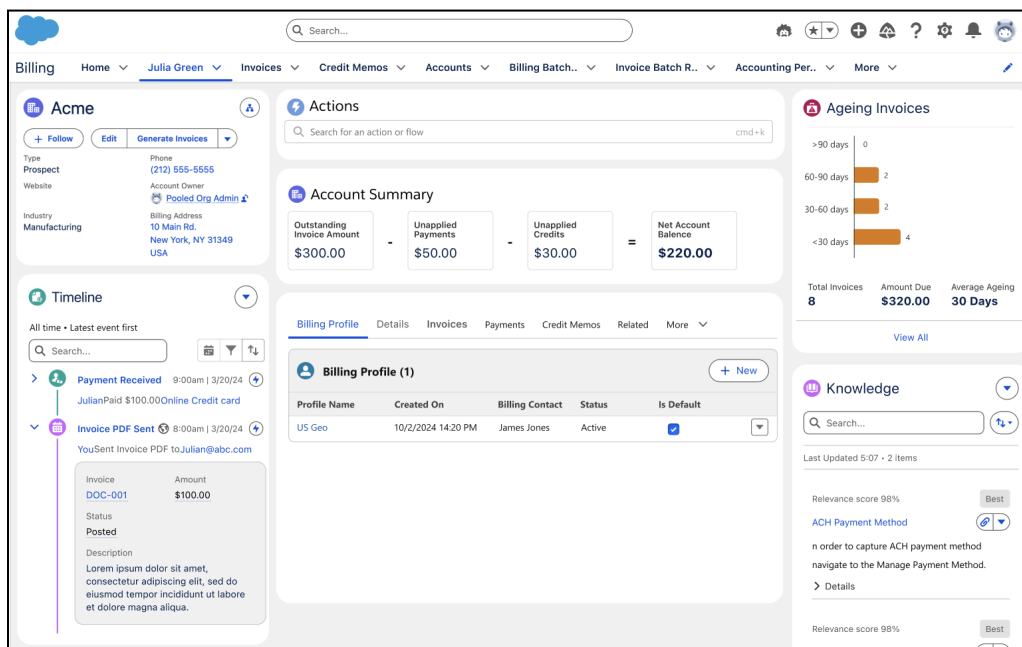

Design Time Configuration

No additional design-time configuration is required.

To ensure full functionality of Account 360, make sure the Timeline feature is enabled.
If it's not already active, navigate to:

Setup > Timeline, and **enable** the setting.

Billing Operations Console

Business Objective

Billing operations teams need a centralized console to monitor daily billing activities, track invoice run health, and swiftly address exceptions. The Billing Ops Console, accessible via the Billing App Home tab, delivers real-time insights and anomaly detection, enabling proactive management of billing processes to ensure timely and accurate invoice execution, reduce manual interventions, and enhance operational efficiency.

Use Cases

- Monitor daily invoice run summaries to track billing progress and completion status.
- View upcoming billing schedules to plan resources and prevent delays.
- Identify and drill into invoice exceptions and failures for rapid root cause analysis.
- Take corrective actions directly from the console to resolve billing issues quickly.
- Gain real-time visibility into invoice health and operational metrics to maintain billing accuracy.
- Reduce manual effort by automating exception detection and status tracking.
- Enable proactive issue management to minimize billing disruptions and revenue impact.
- Provide a single pane of glass for billing operations teams to collaborate effectively.

Design Time Configuration

No design Time Needed. This comes out of the box.

Configuration and Runtime Video

[Billing Ops Console Demo](#)

Preview Invoice UI and Document Generation

Business Objective

Sales Representatives and Billing Operations teams need the ability to preview upcoming invoices for customer transactions and share these previews with customers proactively. Delivering a custom UI that displays invoice previews—including bundle structures and details for Accounts or Billing Schedule Groups (BSG)—helps reduce billing errors, enhances transparency, and improves customer trust and satisfaction.

This is only available with RCB License. Preview API is available with RCA license but the UI part is in RCB only.

Use Cases

- Preview the next two invoices for a new sales transaction to validate billing details before finalization.
- Display invoice bundle structures within the preview to clarify charges and components for complex products or services.
- Send invoice preview documents directly to customers to provide advance visibility and avoid billing surprises.
- Show invoice previews for both individual Accounts and Billing Schedule Groups (BSG), including New and Account Receivable Collection (ARC) scenarios.
- Enable Sales Reps to review and confirm invoice accuracy before committing to billing.
- Support Billing Ops in reducing disputes by catching errors early in the billing cycle.
- Improve customer communication and transparency through proactive sharing of billing information.

Design Time Configuration

No design Time Needed. This comes out of the box.

Runtime Procedures

Generate Preview Invoices for Orders and Accounts

Preview invoices for the next two billing periods for orders and accounts. Generate and download PDFs of the preview invoices to verify order products and estimated charges. The Preview Invoices quick action is available by default on both the order page layout and the account page layout.

1. Open the Account or Order record that you want to generate an invoice preview for.
2. From the quick actions menu, click Preview Invoices.
3. Select a preview date.

The selected start date is the target date for the first invoice preview. If you select two billing periods, the target date for the next invoice preview is calculated by adding the transaction's shortest billing frequency to the previous invoice preview's target date. The default value of the start date is the current date and default billing period is 2. If you select March 3, 2025, as the start date, the number of billing periods as two, and the shortest billing frequency as monthly, invoice previews are generated for March 3, 2025, and April 3, 2025.
4. Select up to two billing periods.
5. Click Preview.

Preview Invoices for Billing Schedule Groups

Verify order products, product quantities, estimated charges, and tax calculations by previewing invoices for the next two billing periods of billing schedule groups.

1. Open the Billing Schedule Group record that you want to generate an invoice preview for.
2. Go to the Preview Invoices tab, select a preview date and the number of billing periods.

The screenshot shows the Salesforce interface for a Billing Schedule Group record. The record ID is BSG-000000002. The record details include: Asset (Google Workspace), Billing Account (IndraNet Test), Effective Next Billing Date (1/1/2025), Total Billed Amount (USD 0.00), Total Pending Amount (USD 240.00), and Start Date (1/1/2025). The tabs are Details, Related, Billing Schedules, Billing History, and Preview Invoices. The Preview Invoices tab is active, showing a Preview Date of Jun 4, 2025 and a Billing Period of 2. A Preview button is visible.

By default, the preview date is set to the effective next billing date of the billing schedule group, and the billing period is set to 1. You can change the start date and the number of billing periods.

3. Click Preview.

Invoice previews are generated for a selected number of billing periods.

Milestone Billing UI

Business Objective

Revenue and Billing teams need a simplified and intuitive way to configure milestone-based billing schedules to align invoicing with project delivery or contractual phases. The Milestone Billing UI offers a user-friendly interface to create, update, and manage milestone plan items efficiently. This ensures better accuracy, reduced setup time, and a clear view of billing expectations tied to key delivery events.

This is only available with RCB License

Use Cases

- Easily add, update, or delete milestone plan items using a guided, intuitive interface.
- Quickly configure a Standard Milestone Plan to reflect agreed-upon project or contract milestones
- Automatically generate a remainder milestone for any unallocated portion of the billing schedule.
- Activate and view the updated milestone plan with all configured items in a single view post-save.
- Ensure billing is aligned to delivery checkpoints, such as project phases, go-lives, or service completion.
- Reduce configuration errors and manual tracking by managing milestone logic within a structured UI.
- Improve collaboration across finance and delivery teams by making billing plans easier to set up and review.

Design Time Configuration

No Design Time Needed.

Configuration and Runtime Video

1. From the App Launcher, find and select Billing Milestone Plan.
2. Click and open a desired Billing Milestone Plan.
3. Click on Configure Milestones

Enhanced Invoice Document Template

Business Objective

Customers and Billing Operations teams need clearer, more informative invoice documents to reduce confusion, improve transparency, and accelerate collections. The enhanced invoice document template introduces critical improvements such as bundling hierarchy visualization (up to 3 levels), display of net credits applied, and a description column for usage and milestone-based billing lines. These enhancements ensure that invoices are easier to understand for both internal users and customers, reducing back-and-forth inquiries and supporting a smoother billing and payment experience.

This is only available with RCB License

Use Cases

- **Display up to 3 levels of bundling hierarchy** on the invoice to clearly show parent-child product relationships, especially useful for complex SaaS or bundled offerings.
- **Show net credits applied on the invoice**, providing transparency on adjustments and helping customers understand the final amount due.
- **Include a 'Description' column for usage and milestone invoice lines** to clarify what is being billed and why, improving invoice comprehension.
- **Enable customers to review and validate billed amounts more easily**, reducing disputes and follow-ups.
- **Support internal finance or collections teams** in explaining invoice details quickly and confidently.
- **Improve professional appearance and completeness** of invoice documents to enhance customer trust.
- **Streamline the collections process** by sending invoices that are clear, accurate, and self-explanatory.

Design Time Configuration

Enable Document Generation in Billing Settings to load the default Invoice Template.

Configuration and Runtime

Video

Newly Introduced changes are:

- Bundling hierarchy visualization extended to three levels.

- Net Credits Applied on Invoice is now displayed
- Description column for Usage and Milestone billed invoice lines to indicate which milestone or usage item is billed.

Write Off Invoices API and Invocable Action

Business Objective

Finance and billing teams require an efficient, automated method to handle uncollectible or partially paid invoices. The Write-Off Invoice API and its corresponding Invocable Action in Salesforce Billing enable organizations to systematically write off outstanding invoice balances. This functionality ensures accurate financial records, streamlines the collections process, and maintains compliance with accounting standards by reducing manual interventions and potential errors.

This is only available with RCB License

Use Cases

- **Automated Write-Offs for Aged Invoices:** Implement scheduled processes to automatically write off invoices that have remained unpaid beyond a certain threshold (e.g., 180 days), ensuring timely financial reconciliation.
- **Batch Processing of Uncollectible Invoices:** Utilize the Invocable Action within Salesforce Flows to process multiple invoice write-offs simultaneously, enhancing operational efficiency
- **Integration with Collections Workflow:** Incorporate the write-off functionality into existing collections workflows, allowing collections agents to trigger write-offs directly from the collection plan when recovery efforts are exhausted.
- **Compliance and Audit Readiness:** Maintain a clear audit trail by recording write-off actions, including reasons and timestamps, ensuring transparency and compliance with financial regulations.
- **Real-Time Financial Reporting:** Ensure that financial reports reflect the most accurate data by promptly writing off bad debts, providing stakeholders with up-to-date financial data.

Design Time Configuration

No design time needed.

Configuration and Runtime Video

Methods to Write Off Invoices

Write off invoices by using the [Write-Off API](#) or by automating the process with the [Write Off Invoices](#) invocable action. The API or invocable action creates and applies credit memos to settle the invoices. The credit memos created to write off invoices are always of the Invoice Write-Off category.

Note The credit memos are applied to the invoice or invoice lines based on the credit and payment application level set on the Billing Settings page. See [Apply Credits to Posted Invoices or Invoice Lines](#).

Impact of Invoice Write-Offs

The write-off process triggers specific updates to relevant records and fields. On an invoice record, these fields are updated: Write Off Status, Write Off Charge Amount, and Write Off Tax Amount fields. On the credit memo records, the **Credit Memo Reason Code** field is updated.

[Configuration and Runtime Video](#)

 [Write Off Invoice API](#)

Create Standalone Credit Memo

Business Objective

Credit Operations teams need a fast and user-friendly way to create standalone credit memos for customer appeasements or adjustments. Enabling quick credit memo creation directly from the Credit Memo list or Account 360 page helps ensure timely credit processing, improves the customer experience, and streamlines internal operations by automatically applying credits in the next invoice.

Use Cases

- Create a standalone credit memo for a customer without linking it to a specific invoice or line item.
- Launch credit memo creation directly from the Credit Memo list view or Account 360 page.
- Enter credit details and post the memo for the credit to be applied in the next billing cycle.
- Support appeasements or service-level adjustments efficiently without delays.
- Reduce dependency on invoice-level edits for minor or one-off credits.

Design Time Configuration

No Design Time Needed. Comes out of the box.

Configuration and Runtime Video

1. From the App Launcher, find and select Credit Memos.
2. Click Create Credit Memo.

The screenshot shows the 'Create Credit Memo' form in Salesforce Revenue Cloud Billing. The form is organized into three main sections: General Details, Credit Amount Details, and Shipping and Billing Information. In the General Details section, the Account Name is 'University of California Berkeley', the Status is 'Posted', and the Effective Credit Date is 'Apr 4, 2025'. The Tax Strategy is set to 'Manual Override', and the Tax Treatment is 'Select a Tax Treatment...'. The Credit Amount Details section shows a Product ID of 'Laptop', a Credit Amount of '100.00', and a Manual Override Tax Amount of '5.00'. The Product Name is empty, and the Currency ISO Code is 'USD - U.S. Dollar'. The Shipping and Billing Information section includes fields for Billing Address and Shipping Address, each with sub-fields for Street, City, and State/Province. The form concludes with 'Cancel' and 'Create' buttons.

3. Enter an account name.
The credit memo status is set to posted and can't be modified.
4. Enter the credit memo effective date.

5. Select a tax strategy to define your tax calculation approach.

Ignore	Skips the creation of tax lines.
--------	----------------------------------

Manual Override	Uses the tax amount specified in the Manual Override Tax Amount field.
-----------------	--

Calculate	Computes tax lines by using the tax treatment ID.
-----------	---

6. If your tax strategy is Calculate, select a tax treatment.
7. If needed, provide a description for the credit memo.

8. Select the product ID that you want to associate with the credit. Enter the product name if the product isn't in your Salesforce org.
Either a product ID or product name is required to create a credit memo.
9. Enter the credit amount.
10. If your tax strategy is Manual Override, enter a manual override tax amount.
11. Select the currency of your credit amount.
12. If needed, enter the billing and shipping address.
- 13.** Click Create.

Configuration and Runtime Video

 [Standalone Credit Memo](#)

Create Credit Memo for Invoice Line

Business Objective

Credit Operations teams need the ability to efficiently create credit memos against specific invoice lines to address partial billing adjustments or disputes. Enabling credit creation and application directly from the invoice—by selecting one or more lines—streamlines the credit process, improves user efficiency, and enhances customer satisfaction through faster resolution.

Use Cases

- Launch the credit memo process directly from an invoice record in the Billing App.
- Select one or more invoice lines that require a credit adjustment.
- Quickly create and apply a credit memo with just a few clicks—no need for manual entry or offline calculation.
- Support partial credits, pricing errors, or product/service issues with precise, line-level adjustments.
- Ensure applied credits are accurately reflected in billing and reporting.
- Enhance Credit Ops productivity with an intuitive and guided credit creation flow.

Design Time Configuration

No design time needed.

Configuration and Runtime Video

1. From the App Launcher, find and select Invoices.
2. Open a posted invoice that the invoice lines belong to.
3. Go to the invoice related list.
4. From the invoice lines section, click View All.
5. On the invoice lines page, select one or more invoice lines that you want to apply the credit memo to.

6. Click Create and Apply Credit Memo.

2 Items selected

Name	Line Amount	Quantity	Unit Price	Invoice Line Start Date	Invoice Line End Date	Type
1 Google Workspace	USD 27.50	1.00	USD 25.00	2/1/2025	2/28/2025	Charge
2 Google Workspace	USD 27.50	1.00	USD 25.00	1/1/2025	1/31/2025	Charge

Create and Apply Credit Memo

Product	Line Amount	Line Charge Amount	Line Tax Amount	Invoice Line Balance	Credit Amount	Enable tax calculation	Credit Tax Amount	Total Credit Amount
1 Google Workspace	USD 27.50	USD 25.00	USD 2.50	USD 27.50	USD 10.00	☐	USD 4.00	USD 14.00
2 Google Workspace	USD 27.50	USD 25.00	USD 2.50	USD 27.50	USD 15.00	☐	USD 3.00	USD 18.00

Cancel Create and Apply

7. For each invoice line, enter the credit amount that you want to apply.
8. The credit amount must be zero or greater and must not exceed the invoice line balance.
9. Define the tax calculation strategy.
10. Deselect enable tax calculation Compute tax lines by using the API.
11. Select enable tax calculation Use the amount in the Credit Tax Amount field instead of automatic tax line calculation. If the Credit Tax Amount field is blank, ignore the tax lines.
12. Click Create and Apply.

Billing Schedule Group Visualization

Business Objective

Billing Operations teams need a clear and consolidated view of all transactions associated with a Billing Schedule Group (BSG), including its relationships with other BSGs, to manage billing activities effectively. The BSG Visualization provides a single, intuitive interface where users can see all related billing schedules—as well as parent-child BSG relationships. This improves visibility, reduces navigation effort, and helps users understand billing structures and dependencies at a glance.

Use Cases

- Access a BSG record to view all related transactions in one place, including invoice lines, credit memos, and billing schedules.
- Visualize parent-child relationships between BSGs to understand how related billing groups are structured and connected.
- Improve decision-making and operational response by understanding the dependencies between related BSGs.
- Reduce navigation overhead and provide a clearer view of complex billing scenarios through visual relationship mapping.

Design Time Configuration

No Design Time Needed

Configuration and Runtime Video

1. Visit a BSG and click on the “Billing Schedules” tab to see the visualization.

Billing Profile

Business Objective

Billing Operations teams need the ability to configure and manage billing preferences at the account level to support customer-specific invoicing needs. The Billing Profile feature enables creation of one or more billing profiles per account—each with unique configurations such as billing address, payment terms, Bill Day of Month (BDOM), and Bill-to Contact. This ensures billing is executed accurately based on customer preferences, supports complex billing scenarios, and improves operational flexibility and customer satisfaction.

Use Cases

- Create one or more billing profiles against a customer account to reflect different billing preferences for various scenarios (e.g., business units, locations, departments).
- Set a default billing profile that will be applied automatically when no profile is specified during transaction processing.
- Specify billing configurations such as BDOM, payment terms, billing address, and Bill-to Contact per profile.
- Pass a specific billing profile when creating or processing a transaction to override the default settings.
- Ensure transactions are billed correctly and consistently in alignment with customer agreements.
- Support multiple business models or customer hierarchies by allowing profile-level billing variation under the same account.
- Improve billing accuracy and reduce manual corrections by capturing preferences upfront.

Design Time Configuration

1. From the App Launcher, find and select Billing.
2. From the navigation bar, click Accounts.
3. Open the account that you want to create a billing profile for.

4. In the Billing Profile section, click New.

The screenshot shows the Salesforce Revenue Cloud Billing interface. The main page displays the 'AnyPartner Inc.' account details, including a timeline of events. A modal titled 'New Account Billing Account' is open, showing the 'Account Billing Account' section. The 'Account' field is populated with 'AnyPartner Inc.' and the 'Billing Account' field is empty. A 'New' button is highlighted in the top right corner of the modal.

5. Verify the account name.
6. Create a billing account.
 - Click the Billing Account field.
7. Click New Billing Account.

The screenshot shows the 'New Account Billing Account' modal with the 'Billing Account' field selected. The 'Account' field is populated with 'AnyPartner Inc.' and the 'Billing Account' field is empty. A 'New' button is highlighted in the top right corner of the modal. Below the 'Billing Account' field, there is a section titled 'Recent Billing Accounts' which lists 'AnyPartner Inc.- Default Billing Account' and 'AUser'. A '+ New Billing Account' button is also visible.

- Enter a name for the billing account.

- Enter the primary billing address.
 - Enter the shipping address.
 - Enter the bill day of month.
 - Select a bill to contact.
 - Select the payment terms.
8. Save the billing account.

9. To make this the default billing profile, select Default Billing Account.
You can set only one default billing profile for an account.
10. Save the account billing account.
When billing processes a transaction or order, it first checks for fields such as payment terms and billing address provided in the transaction.

- If these fields are present, billing uses them.
- If they are missing and the transaction is associated with a billing account, billing uses the fields from that account.
- If the transaction has no fields and isn't associated with a billing profile, billing uses the account's default billing profile.

Configuration and Runtime Video

 [Billing Profile Creation](#)

Standalone Billing API

Business Objective

Enable a flexible and scalable billing engine by allowing billing schedules to be created from any internal or external transaction through context-aware APIs. This decouples the billing logic from specific Salesforce objects and empowers organizations to initiate billing from custom objects, external platforms, or industry-specific systems (like insurance, healthcare, or field services).

The goal is to provide a configurable and reusable framework that supports new sales, renewals, amendments, usage, cancellations, and ramped billing—all without tight coupling to standard quote/order objects

Use Cases

- **Work Order Billing:** Generate billing schedules directly from Work Orders instead of Orders.
- **Usage-Based Billing:** Bill based on usage or sensor data, not tied to CPQ.
- **Insurance Premium Billing:** Create billing schedules from Policy objects.
- **Bundled Product Billing:** Handle ramped, tiered, and mixed-frequency billing for bundles.
- **External Cart Integration:** Bill from external platforms using cart or checkout data.
- **Subscription Lifecycle Billing:** Support renewals, amendments, and cancellations via context

Configuration and Runtime Details

Follow the [Billing API Developer documentation](#) to get more information

Capture Corporate Currency Equivalents of Payment & Refund

Business Objective

Additional attributes that capture the snapshot of corporate currency equivalents for billing transactions which have non-corporate currency as isocode, to be used for calculating Foreign Exchange Gain & Loss.

Use Cases

- Capture the Corporate currency equivalents on billing transactions that are having a non-corporate currency
- Capture the snapshot of the exchange rate, date and corporate currency equivalent for the transaction total

Design Time Configuration

- Admin has to setup Advanced Currency Management and ensure there is a process to mention the exchange rates
- Turn on Store Transaction Amounts in Corporate Currency under Billing Settings
- Ensure the Corporate Currency Fields are showing up on page-layouts for the accounts receivable transactions (Payment and Refund)

Configuration and Runtime Video

[Capture Corporate Currency Equivalents for Payments and Refunds](#)

Enhanced GL Accounting Assignment Rules

Business Objective

Flexibility to select the amount field to be used during journal entries.

This is only available with RCB License

Use Cases

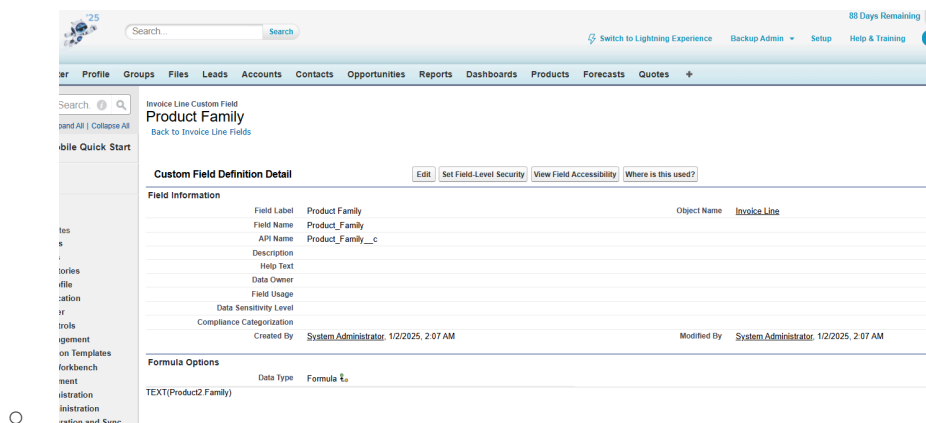

- Custom amounts derived from standard amount fields - a percentage of the total amount (e.g. Brokerage Insurance)

Design Time Configuration

- Review the existing standard amount fields used during transaction journal generation. Customize to create custom fields that can derive the value preferred to be used for journal entries
- Update the General Ledger Account Assignment Rule by deactivating the rule. Update the Criteria to select the amount field to use and Activate the Rule

Configuring a custom field on the criteria

- Lets say we want to manage separate Ledger accounts for Software and Hardware products. Invoice Line has a reference to Product, you can leverage this field to derive the Product Family using a custom Formula field on the Invoice Line.

The screenshot shows the Salesforce interface for defining a custom field. The top navigation bar includes a search bar, a date selector for '25', and links for 'Switch to Lightning Experience', 'Backup Admin', 'Setup', and 'Help & Training'. The main navigation menu lists various Salesforce objects and tools. The left sidebar shows a search bar and a list of navigation items. The main content area is titled 'Product Family' and includes a 'Back to Invoice Line Fields' link. Below the title, there are tabs for 'Custom Field Definition Detail', 'Edit', 'Set Field-Level Security', 'View Field Accessibility', and 'Where is this used?'. The 'Custom Field Definition Detail' tab is active, showing a table of field information. The table has columns for 'Field Label', 'Field Name', 'API Name', 'Description', 'Help Text', 'Data Owner', 'Field Usage', 'Data Sensitivity Level', and 'Compliance Categorization'. The field information is as follows:

Field Label	Field Name	API Name	Description	Help Text	Data Owner	Field Usage	Data Sensitivity Level	Compliance Categorization
Product Family	Product_Family	Product_Family__c						

Below the table, there is a 'Formula Options' section with a 'Data Type' of 'Formula' and a 'Formula' field containing the text 'TEXT(Product_Family)'. The 'Created By' and 'Modified By' fields are both set to 'System Administrator' with timestamps of '1/2/2025, 2:07 AM'.

- Use the custom formula field in the criteria to filter Software and Hardware products and accordingly write to the Ledger Accounts

Define Criteria

Define criteria for the transaction type of the general ledger account assignment rule. Transaction journals are created for transactions of the selected type that meet the defined filter criteria.

 [Enhanced GL Assignment Rules](#)

Support Origin Based Taxation

Business Objective

To ensure tax compliance and accurate tax calculations for states that mandate origin-based taxation, the billing system must support capturing and transmitting the Ship From address along with the Ship To and Bill To addresses. This capability enables companies to comply with regional tax laws, particularly in U.S. states that calculate sales tax based on the point of origin of the goods or services. By introducing Ship From address support at the Billing Schedule Group (BSG), Invoice Line, and Credit Memo Line levels, businesses can now accurately determine applicable tax rates and reduce risk related to tax miscalculation or audit failure.

Use Cases

Compliant Tax Calculation for Origin-Based States

- A customer in **California** receives a shipment from a warehouse in **San Francisco**. The tax is calculated based on the **Ship From** address, as required by CA origin-based tax rules.

Override Default Ship From with BSG Address

- For a complex project, a company uses a different fulfillment center for a specific Billing Schedule Group. The system uses the **overridden BSG Ship From address** for correct taxation.

Automatic Fallback to Legal Entity Address

- If no Ship From address is defined, the system uses the **Legal Entity's address** as the default source location for tax calculation, maintaining data integrity without configuration gaps.

Support for Multi-State Tax Compliance

- A business ships from multiple states like **Arizona, Missouri, Ohio, and Utah**. The updated billing system ensures the correct Ship From address is used per transaction to satisfy local tax compliance.

Design Time Configuration

- When creating a Billing Schedule Group, ensure the ShipFrom Address is mapped in the Billing context for the shipFrom address attributes, else the Legal entity address would be used as default.

Configuration and Runtime Video

[Support Origin Based Taxation](#)

Support Product Level Exemptions

Business Objective

To ensure accurate tax calculation and regulatory compliance, the billing system must support product-level tax exemptions. By identifying tax-exempt products based on their SKU (Stock Keeping Unit), the system can automatically apply correct exemptions during tax computation on invoice lines. This functionality enables businesses to minimize tax liabilities on exempt products such as prescription drugs, medical devices, or charitable goods, and align with regional tax laws and policies.

Use Cases

Automatic Tax Exemption for Eligible Products

- A product such as a **prescription drug** is tax-exempt in many jurisdictions. When the SKU "**PRES-RX-12896745**" is included in an invoice line, the system automatically marks the tax exempt amount, reducing total tax dues.

Health Care and Nonprofit Sectors

- Companies selling to hospitals or charities benefit from **automated exemption recognition**, eliminating manual tax override and ensuring compliance.

Deriving Exemption from Product Catalog

- The tax contract dynamically pulls the SKU from the **Product table**, using the product info in the **order-product-to-billing schedule pipeline**, avoiding redundant configurations or errors.

Reduce Manual Intervention for Tax Adjustments

- Tax exemption logic is baked into the billing workflow, reducing effort for finance teams and minimizing errors in downstream tax reporting.

Design Time Configuration

- Ensure every product has a product code in the system which can be identified by the tax system
- Setup the tax exempt certificates for the product on the Tax Vendor application

Configuration and Runtime Video

 [Tax Features \(0:52 in the video\)](#)

Credit Taxes Based on Original Invoice Date

Business Objective

Ensure tax compliance and accuracy by applying the same tax rate used on the original invoice when issuing a credit. This prevents discrepancies due to tax rate changes over time and aligns with standard accounting and tax reporting practices.

Use Cases

- Use the same tax rate as applied during original invoicing while issuing full or partial credits.
- Ensure tax rate consistency even if the tax rate has changed between the invoice date and credit issuance.
- Support tax audit readiness by maintaining traceable and reversible tax records tied to the original transaction.
- Comply with jurisdictions where tax reversals must match the original tax application.

Design Time Configuration

None

Configuration and Runtime Video

 [Tax Features](#)

RunTime Experience

1. Create an Order with a subscription product with an Advance type treatment
2. Activate the Order to generate Billing Schedules
3. Generate and post the invoice with a specific invoice date
4. Try amending the Order related to the above invoice - Try cancelling it (probably few days / months passed after the above invoice date) - Activate the Order - Billing Schedules with negative lines would be created
5. Generate and post the invoice for the above schedules.
6. Notice the creation of an invoice with negative lines
 - a. Check the tax request for the negative lines, it would be a credit call with the reference to the original invoice document and the original invoice date as effective date

Import or Create Tax Lines

Business Objective

Provide the flexibility to customers to use their system of choice when it comes to calculating taxes beyond the existing options we provide with tax interface and partnerships with Tax Vendors.

Use Cases

Leverage an external system or process/object of choice to calculate taxes and bring them back into the billing system

Design Time Configuration

Ensure the Billing Admin permissions are provided to the user integrating the external system, for the InvoiceLineTax entity

Configuration and Runtime Video

 [Import Tax Lines](#)

Runtime Options

Customers can leverage the data integration tools like DataLoader, etc. which can be used to insert/upsert the InvoiceLineTax records.

Large Volume Billing Transaction Support

Business Objective

As billing volumes grow with large enterprise transactions and complex product bundles, businesses require scalable APIs to handle high transaction throughput efficiently. By increasing the API processing limits for billing transactions and tax calculations, Revenue Cloud supports high-volume use cases—such as order-based billing and large invoice generation—without performance degradation. This ensures scalability, faster processing, and seamless integration with upstream order systems.

Use Cases

- **Bulk Billing Schedule Creation from Orders**
 - Create up to 1,000 billing schedules in a single API call from order lines.
 - Ideal for scenarios where large B2B or usage-based contracts need to be billed quickly.
- **High-Volume Tax Calculation**
 - Calculate taxes for up to 2,000 invoice lines in a single synchronous API request.
 - Useful for batch invoicing processes where each invoice may have hundreds of line items.
- **Enterprise-Scale Billing Automation**
 - Automate billing for enterprise orders with thousands of line items by leveraging the updated API limits.
 - Supports order-to-cash automation in systems that generate thousands of transactions in a single customer event.
- **Upstream Order Integration (e.g., RCA or CPQ Orders)**
 - Seamlessly handle order ingestion into the billing engine by processing up to 1,000 order lines as billing transactions.
- **Partner Tax App Integration**
 - Allows tax partners (via AppExchange) to implement graceful error-handling beyond their supported limits (~700 lines), ensuring robust interoperability with large billing payloads.

Design Time Configuration

No design Time needed.

Configuration and Runtime Video

The number of billing transaction items that can be processed by the Create Billing Schedules From Billing Transactions API	200	1000	Order to Billing Schedule (Support upto 1000 order lines to be created as billing schedules)
The number of lines supported by Calculate Tax API Interface (Sync) Tax Calculation (POST)	200	2000	Request can have 2000 lines. <i>Tax Vendors will update their AppExchange to graciously error out beyond the limits they support (~700).</i>

Scalability	• Invoice batch run can support generating invoices with 2000 invoice lines • Recovery Invoice Batch Run also supports 2000 lines • DRAFT to POSTED for entire IBR also supported for invoices with 2000 lines
Reliability	• Intuitive Status Tracking - Enhanced IBR with sub-statuses making the process more transparent to the billing operations users while monitoring jobs
	• Cleanup - Delete associated RTEs from an IBR on Invoice Recovery Run or Recovery API

Limitations:

- Voiding an invoice with 2000 lines is not supported
- Voiding an entire Invoice Batch Run is not supported

Configuration and Runtime Video

 [Scale and Performance](#)

Payment Guided Setup

Business Objective

Customers implementing Salesforce Billing need a simple and efficient way to configure and activate native or third-party payment gateways to enable payment processing. The Payment Guided Setup provides a step-by-step interface to configure Stripe or Adyen as native gateways, set up merchant accounts, and enable credit card/ACH Debit processing. This streamlined experience reduces time to value, minimizes configuration errors, and empowers customers to quickly start accepting payments through the platform.

This is only available with RCB License

Use Cases

- Use a guided, no-code setup flow to configure native payment gateways such as Stripe or Adyen.
- Set up merchant accounts and connect them directly to Salesforce Billing with minimal technical effort.
- Enable Credit Card/ACH Debit as a supported payment method, using Stripe or Adyen for real-time processing.
- Use “Bring Your Own Gateway” to connect with custom or third-party gateways (outside native Stripe/Adyen), billed under a per-transaction model.
- Configure payment method sets and policies to define which payment types can be used per account or invoice.
- Ensure readiness to automate collections, refunds, and settlements by completing all required setup steps.
- Reduce dependency on technical teams for payment configuration by empowering Payment Admins to complete setup independently.
- Support rapid go-live for payments during implementation or billing transformations.

Design Time Configuration

The Payments feature is available with the Revenue Cloud Billing license, with a cost per transaction model for both native and Bring Your Own payment gateways. Contact your Salesforce account executive for more information.

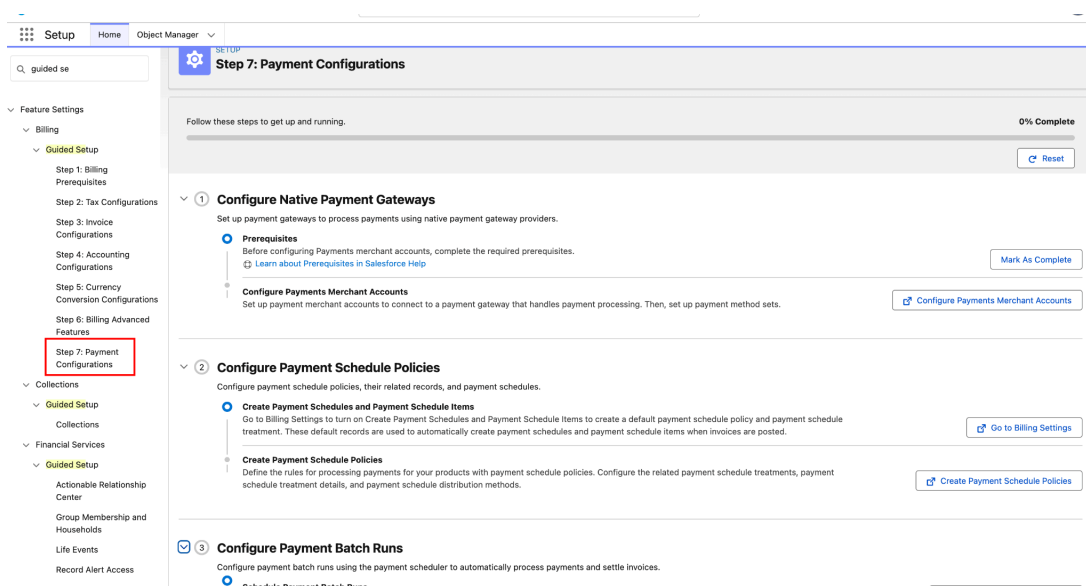

User Permissions Needed

To change digital experience settings: Customize Application

To enable Salesforce Payments: Customize Application

1. Let's Start with the Guided Setup for Payments.
2. Navigate to Setup>Billing
3. Under the Guided Setup Section, see Step 7

4. Follow the steps
5. Configure a Native Payment Gateway. There are 2 steps to it:
 - a. Prerequisites which are needed to enable Salesforce Payments. **The pre-requisites are already configured in the enablement org.**
 - i. [Set up an Experience Cloud site](#) that's used as a channel for payment data to flow from the payment gateway to Salesforce Payments.
 - ii. [Enable Salesforce Payments](#), the native service that you'll use to collect payments for your billing transactions.
 - b. Configure Payment Merchant account:

- i. You can create or connect to Stripe or Adyen merchant accounts as they are natively supported by Salesforce
- ii. Once you are navigated to the Configure Payment Merchant Account, you can choose to either create a fresh new Stripe Merchant Account or
- iii. Choose to connect existing Stripe or Ayden account
- iv. Follow the guided setup when connecting or creating your Stripe/Ayden account
- v. Once completed this is how it would look like

Name ↑	Country	Status	Payment Status	Payout Status
Sravya Account	US	✓ Complete	Enabled	Enabled
Thulasiram Subramaniam	US	✓ Complete	Enabled	Enabled

6. The next step is “**Configure Payment Schedule Policies**” to Create Payment Schedule and Payment Schedule Item.

a. Payment Schedule Policies and Payment Schedule Items

- i. Automated way:
 1. From Setup, in the Quick Find box, enter Billing, and then select Billing Settings.
 2. Turn on Create Payment Schedules and Payment Schedule Items.
 3. When you turn on this feature for the first time, these default records are created:
 - 4.
 5. Default Record For Record Name Key Field Values
 6. Payment Schedule Policy Default Payment Schedule Policy
 7. Payment Schedule Policy Status value: Active
 8. Payment Schedule Treatment Selection value: Default
 9. Payment Schedule Treatment Default Payment Schedule Treatment
 10. Payment Schedule Treatment Status value: Active
 11. Automation Trigger Source value: Invoice Posted
 12. Payment Schedule Treatment Detail Default Payment Schedule Treatment Detail
 13. Installment Payment Type value: Percentage
 14. Percentage value: 100

15. Processing Date Reference value: Invoice Due Date
16. Payment Method Selection Type value: Most Recent Autopay
17. Payment Schedule Distribution Method Default Payment
 Schedule Distribution Method
18. Distribution Method Type value: Full Distribution
19. Distribution Count value: 1
20. A Payment Schedule record and a Payment Schedule Item record are created based on the configuration of these default records. So, each time an Invoice record is posted, a single Payment Schedule record is created with the entire invoice balance amount as the total requested amount. A single Payment Schedule Item record is created for each Payment Schedule record.
21. The user that turns on Create Payment Schedules and Payment Schedule Items is the owner of the default Payment Schedule Treatment record, and the Payment Schedule records and the Payment Schedule Item records that are automatically created. To enable other users to edit Payment Schedule records and Payment Schedule Item records, set the default internal access of the Payment Schedule object and Payment Schedule Item object to Public Read/Write.

ii. Manual Way::

1. From the App Launcher, find and select Payment Schedules.
2. Click New.
3. Select the reference entity and reference record that you want to process payments for.
4. Select a status for the payment schedule.
5. If you want to configure the payment schedule further, select Draft.
6. If the payment schedule is ready to be processed by a payment batch run, select Open.
7. If a payment batch run successfully processes the payment schedule, the status changes to Completed. If a payment batch run fails to process the payment schedule, the status changes to Canceled.
8. Select a saved payment method as the default payment method for the payment schedule.

9. The saved payment method is used to collect payments for all the payment schedule items that are related to the payment schedule.
10. You can't specify a card payment method as the default payment method in Salesforce orgs with the Revenue Cloud Billing license.
11. Enter any additional details about the payment schedule as comments.
12. Enter the total amount that you want the payment schedule to process as a payment for the reference record.
13. Save your work.
14. The Payment Schedule record that's created has the account that's related to the reference record as the payment account.
15. After you create a Payment Schedule record, create payment schedule items for that record.
16. To Create Payment Schedule Items, follow :
https://help.salesforce.com/s/articleView?id=ind.billing_payment_schedule_items_create.htm&type=5

b. Create Payment Schedule Policies

Capture and Save Payment Method

Business Objective

Customers need a secure and streamlined way to capture and store payment methods to support future billing and automated collections. By enabling the capture and storage of payment methods—such as credit cards or ACH Bank Details—Salesforce Billing ensures seamless payment processing, enhances customer convenience, and reduces the risk of failed or delayed payments. This capability also supports use cases like auto-pay, scheduled payments, and faster checkout for repeat transactions.

This is only available with RCB License

Use Cases

- As a Billing or Payment Ops user, I can securely capture a customer's payment method (e.g., credit card) during onboarding or at the time of sale.
- As a customer, I can provide and authorize a payment method for recurring billing or future one-time use.
- Automatically associate saved payment methods with an account or billing profile for seamless invoice payment processing.
- Support auto-pay functionality, where invoices can be settled using the stored payment method without manual intervention.
- Enable refund processing back to the original payment method used.
- Allow multiple saved payment methods per account, with the ability to mark one as default.
- Enhance payment security and compliance by using tokenized storage provided via native integrations with Stripe or Adyen

Design Time Configuration

Before saving payment methods for accounts, complete these prerequisite steps:

1. To enable standard users to create saved payment methods by using the Merchant Account records created by system administrators, select the [default internal access of the Merchant Account object to Public Read Only](#).
2. [Add the Dynamic Related List-Single component](#) to the Saved Payment Method tab of Account records, and select Saved Payment Methods as the related list.

Configuration and Runtime Video

Create Saved Payment Methods

You can save multiple payment methods for a single account. You can also save the same payment method for different customer accounts.

1. **From the App Launcher, find and select Billing**, and then click Accounts.
2. Open the Account record (**Acme**) for which you want to enter and save a payment method.
3. From the Saved Payment Methods tab, select the merchant account that you want to use for receiving payments from the account.
You can save payment methods for different customer accounts with the same payment merchant account.
4. Select whether you want to enter credit card details or bank account details, and then enter the required details.
The combination of merchant account and payment method for an account must be unique.
5. Click Save Payment Method.

The saved payment method appears in the Saved Payment Methods related list of the Saved Payment Method tab.

If the saved payment method you're creating has the same merchant account and payment method details as an existing record, but contains changes to other details, such as the name on the card, the details of the existing record are updated. In this scenario, a new record isn't created.

Configuration and Runtime Video

[Save Payment Method](#)

Scheduled Batch Payments

Business Objective

Payment Operations teams need an automated way to manage and settle payments against posted invoices to reduce manual effort, eliminate delays, and ensure accurate revenue recognition. The Payment Scheduler automates the creation of payment schedules and associated items, enabling timely and consistent collection of payments once an invoice is posted. By filtering based on payment method or schedule item, Payment Ops can gain more control and transparency over the collection process, improving operational efficiency and supporting predictable cash flow.

This is only available with RCB License

Use Cases

- Automatically trigger payment collection once an invoice is posted, reducing manual follow-ups.
- Create payment schedules and corresponding schedule items to break large invoice amounts into manageable installments.
- Filter payment processing based on Payment Method (e.g., ACH, Credit Card) or Payment Schedule Item (e.g., due date, amount).
- Track and manage payment statuses linked to each invoice, ensuring clear visibility into what's been collected and what's pending.
- Improve payment operations accuracy by reducing human error in manual settlements.
- Accelerate revenue realization by automating the payment lifecycle and reducing Days Sales Outstanding (DSO).
- Support flexible collection strategies such as milestone-based or recurring payments.
- Enable Payment Ops to monitor failed or pending payments and take timely corrective actions.

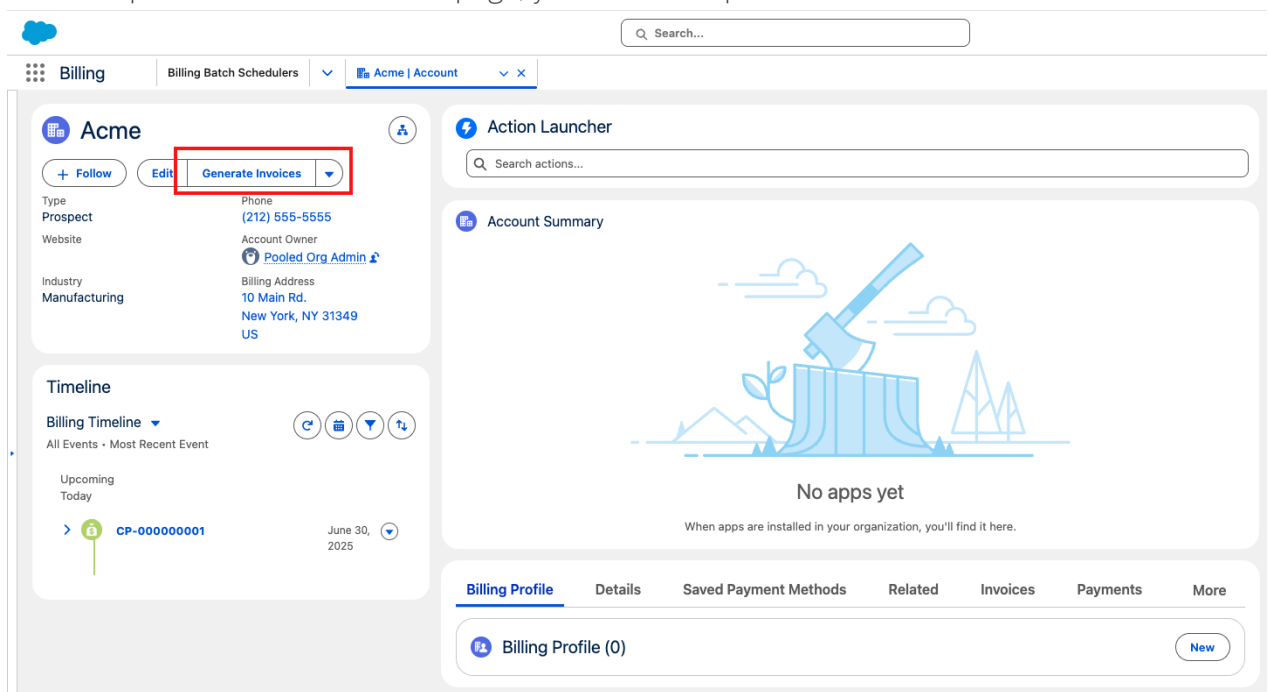

Design Time Configuration

Set up a payment scheduler with specific filters to automatically process payments for your transactions. Payment batch runs process **existing payment schedules and payment schedule items** to collect the corresponding payments, and then apply them to invoices based on the payment application level. **Payment Schedules will be automatically created if the setting “Create Payment Schedules and Payment Schedule Items” is enabled in Billing Settings when Invoice is posted** or you can manually create Payment Schedules and Payment Schedule Items.

Creating Payment Schedules and Payment Schedule Items

1. From the App Launcher, find and select Billing App
2. From the Accounts, select Acme
3. On the top left within the account page, you will see a quick action “Generate Invoices”

4. Click on Generate Invoices and fill in the details to generate Invoice for Acme
 - a. Target Date - 6/1/2025 (So that Payment Scheduler below can pick this up)
 - b. Invoice Date - 6/1/2025

c. Status - Posted

Generate Invoices

Generate invoices for all the billing schedules that are ready for invoicing and meet the criteria that you define.

* Target Date ⓘ
Jun 1, 2025

* Invoice Date
Jun 1, 2025

* Status
Posted

Generate

5. Once the invoice is generated and in posted status, you should see Payment Schedules and Payment Schedule Items created for it

Creating Payment Scheduler

1. From the App Launcher, find and select Billing Batch Schedulers.
2. Click New Payment Scheduler.
3. Enter a name for the payment scheduler.
4. To activate the payment scheduler, select Active.
5. Payments are collected and applied only when the scheduler is active. You can create payment schedulers in inactive state, and modify and activate them later.
6. Select the frequency at which you want the payment batch to process payments.
7. If you select Once, select a start date and a start time for the scheduler.
8. If you select Daily, select a start date and a start time, and an end date for the scheduler.
9. If you select Monthly, select a start date and a start time, and an end date for the scheduler. Additionally, select the number of days after which you want the monthly payment batch run to recur.
10. Click Next.
11. To configure additional matching criteria for the payment scheduler, select Match Any, select Payment Schedule Item as the Type, Payment Run Matching Value as the Column, and select the payment run matching value that you want to filter payment schedule items by.
12. By default, no matching criteria is selected. If you don't specify a matching criteria, the default matching criteria is used to determine the payment schedule items that the

payment batch run must process. **With the default matching criteria, all the payment schedule items with a target payment date (TargetPaymentProcessingDate) that's less than or equal to the job run date are processed by the payment batch runs.**

13. Click Create.

14. Once the payment schedule is complete, it should have created the payment for Acme

Configuration and Runtime Video

Payment as a Platform in RCB

Business Objective

Apart from automated payments processing in batches, RCB also provides its customers with added capabilities to initiate individual payment requests, refund requests or leverage its APIs to apply a payment against any available Invoice etc. Once necessary configurations are done for gateways and save payment methods . Customers will have access to below set of APIs to perform certain actions (indicated in use cases)

1. Sale API : Customers can make a sale API call to initiate payment request . Upon successful processing system creates a payment record with all the necessary details passed in the API
2. Auth API : For use cases where authorization of the funds is required against a payment method customers can use Auth API
3. Capture API : Any authorized payment request can be captured using this API . Upon success system creates a payment record for the authorized amount
4. Refund API : Customers can issue refunds with a payment record as source of truth
5. Apply & Unapply APIs : Customers can use apply API to apply a payment against an Invoice and unapply from an Invoice using unapply API

This is only available with RCB License

Use Cases

- As a payment operations user I want to initiate a (individual) payment request so that Invoice is paid on time
- As a payment ops user I want to ensure that the amount committed by my buyer is authorised and captured so that I can ensure that my receivables are intact
- As a payment ops user I should be able to issue a refund if any cancellation or downsell happens . I should able to trigger a refund to original payment method
- As a payments ops user I should be able to use existing payment record and apply against an Invoice so that I can settle the invoice on time
- As a payment ops user I should be able to unapply a payment form an invoice

Design Time Configuration

Customers can create flows using Invocable actions for (No OOTB config provided) :

- Sale API
- Apply API
- Unapply API

Collections with Billing

Business Objective

Finance and Collections teams require an integrated, automated solution to manage overdue invoices, streamline collection activities, and enhance cash flow visibility. Salesforce Billing's Collections feature offers a centralized platform to track outstanding balances, automate follow-ups, and efficiently manage collection processes. By leveraging native Salesforce capabilities, organizations can reduce Days Sales Outstanding (DSO), minimize revenue leakage, and improve customer relationships through timely and transparent communication.

This is only available with RCB License

Use Cases

- Monitor and manage overdue invoices: Access real-time dashboards and reports to identify delinquent accounts and prioritize collection efforts.
- Automate payment reminders: Set up automated workflows to send payment reminders to customers based on predefined criteria, reducing manual intervention.
- Track collection activities: Log and monitor all collection-related interactions, ensuring a comprehensive view of customer communications and actions taken.
- Integrate with payment gateways: Facilitate seamless payment processing by integrating with supported payment gateways, allowing customers to settle dues promptly.
- Analyze collection performance: Utilize analytics to assess the effectiveness of collection strategies, identify bottlenecks, and make data-driven decisions to optimize processes.
- Enhance customer communication: Provide customers with clear and timely information regarding their outstanding balances, fostering trust and reducing disputes.

Collections Promise to Pay

Business Objective

Collections teams need a structured and reliable method to record a customer's commitment to pay outstanding invoices. The Create Billing Promise to Pay flow enables reps to formalize payment promises and generate payment schedules directly within the collection plan. This enhances the predictability of cash inflow, reduces manual tracking of commitments, and improves the overall efficiency of collections operations.

This is only available with RCB License

Use Cases

- **As a collections rep**, I can initiate the **Promise to Pay flow** from a collection plan item to record a customer's commitment to pay a specific invoice balance.
- **Automatically generate a payment schedule and schedule items** based on the customer's agreed payment timeline.
- **Track the status of promised payments** and align follow-up actions (emails, calls, reminders) accordingly.
- **Improve accountability and transparency** by documenting every payment promise within the system.
- **Allow flexibility** in payment terms by splitting overdue balances into manageable installments.
- **Enable better prioritization of collection tasks** by identifying which customers have active promises versus those requiring escalation.

Design Time Configuration

1. Open a Collection Plan record related to the collection plan item that you want to collect payment promises for.

2. From the Collect Payment Promises tab, click New Payment Promise.
The Create Billing Promise to Pay flow runs and shows a list of collection plan items related to the Collection Plan record.
3. Select a collection plan item for which you want to create payment schedule and payment schedule items.
4. Click Next.
A list of existing payment schedules that are related to the invoice of the selected collection plan item appear.
5. Collect payment promise details.
 - a. Select the number of partial payments in which the customer wants to repay the overdue amount.
You can select up to three partial payments.
 - b. If the customer wants to make a single payment, in the First Partial Payment Amount field, enter the total payment amount, and select a payment date.
 - c. If the customer wants to make multiple partial payments, enter the payment amount and select the corresponding payment date for each partial payment.
The sum of all the partial payments can be equal to or less than the invoice balance.
 - d. Select a saved payment method, and click Next.

The payment schedule and payment schedule items that you created for the selected collection plan item appear in the Collect Payment Promises tab. The payment batch run picks up the payment schedule items that are ready for processing and processes the payments based on saved payment methods. After the payment is made, the batch run applies the payment to the invoice lines. See [Payment Batch Run Overview](#)

When you create payment schedules manually for collection plan items, the currency ISO code of the collection plan item is used as the payment schedule's currency ISO code regardless of the currency ISO code that you choose on the New Payment Schedule page.

Dunning in Collections

Business Objective

Finance and collections teams require an automated, structured, and scalable approach to manage overdue invoices and enhance cash flow. The Dunning process in Salesforce Billing enables organizations to systematically communicate with customers regarding outstanding payments through scheduled reminders and tasks. By leveraging configurable dunning methods and activities, businesses can reduce manual efforts, improve collection efficiency, and maintain positive customer relationships.

This is only available with RCB License

Note -

In order to use this feature, your Org must be provisioned with Data Cloud licenses. In the Revenue Cloud Enablement Orgs, Data Cloud is provisioned on an individual case basis by requesting the assignment and activation of Data Cloud, Einstein, and Agentforce licenses. Please use [this link](#) to submit a request to provision those required licenses to complete the following exercises. You will be notified when the licensing in your training Org has been updated.

Use Cases

- **Automated Dunning Campaigns:** Configure dunning methods with predefined activities (e.g., emails, calls) that trigger based on the account's collection status. When an account's status changes to "In Collections," the system automatically generates a collection plan with scheduled tasks for the collections agent.
- **Personalized Customer Communication:** Send timely and personalized email reminders to customers about overdue balances or upcoming payments. Utilize Salesforce's out-of-the-box email capabilities or integrate with Marketing Cloud for enhanced communication channels like SMS and calls.

- **Task Management for Collections Agents:** Assign tasks to collections agents based on the dunning activities defined in the dunning method. Tasks are scheduled with specific due dates, ensuring timely follow-ups and consistent customer engagement.
- **Monitoring and Reporting:** Track the effectiveness of dunning strategies through reports and dashboards. Analyze metrics such as the number of overdue invoices, collection plan statuses, and agent performance to optimize the collections process.
- **Flexible Dunning Strategies:** Create multiple dunning methods tailored to different customer segments (e.g., standard, VIP, proactive). This allows for customized communication strategies that align with customer profiles and payment behaviors.
- **Integration with Collections Plans:** Link dunning activities directly to collections plans, providing a comprehensive view of all actions taken for overdue accounts. This integration ensures that all collection efforts are coordinated and documented within the system.

Billing Central Dashboard

Note -

In order to use this feature, your Org must be provisioned with Data Cloud licenses. In the Revenue Cloud Enablement Orgs, Data Cloud is provisioned on an individual case basis by requesting the assignment and activation of Data Cloud, Einstein, and Agentforce licenses. Please use [this link](#) to submit a request to provision those required licenses to complete the following exercises. You will be notified when the licensing in your training Org has been updated.

Business Objective

Businesses need a centralized and intelligent view of billing performance and invoice operations to proactively manage billing health and ensure smooth billing cycles. The Billing Central Dashboard, part of the Revenue Management Intelligence SKU and powered by Tableau and Einstein, delivers real-time insights into key billing metrics and invoice statuses. Integrated with Data Cloud, it empowers billing teams to identify anomalies, take timely action, and reduce revenue leakage—enhancing operational efficiency, billing accuracy, and customer satisfaction.

Use Cases

- Monitor overall billing health with real-time visibility into billing volume, success rate, failures, and exception trends.
- Track invoice generation performance, including success/failure rates across invoice runs, to identify and resolve issues proactively.
- Drill into failed invoice records to analyze root causes and take corrective action without leaving the dashboard.
- Identify revenue leakage caused by missed or failed invoices and take timely action to recover lost revenue.
- Empower billing operations teams with actionable insights to streamline daily processes and reduce manual effort.
- Enhance audit readiness by providing transparent logs and traceability of invoice processing over time.
- Support operational KPIs by tracking invoice run duration, throughput, and exception clearance time.
- Enable collaboration across teams (finance, operations, IT) by using a single source of truth powered by Tableau visualizations.
- Facilitate executive reporting with summarized billing health metrics and trends for leadership decision-making.

Design Time Configuration

Rev Analytics Docs

This document speaks about the complete Installation Steps for Billing Apps.

Configuration and Runtime Video

1. Once installed, the Billing Central Dashboard will be accessible as a new option in the Billing App dropdown menu.
2. On the Account Page, two new widgets will be available:
 - a. Account Summary:
 - i. Provides a snapshot of the customer's current financial status.
 - ii. Displays total charges, payments received, and outstanding balances.
 - b. Overdue Invoices:
 - i. Lists all overdue invoices linked to the account.

- ii. Shows the due amounts and helps prioritize follow-up actions.
