Header Adjustments for transaction level discount

Business Objective

Currently, Revenue Cloud lacks a straightforward mechanism to apply a discretionary discount at the transaction header level that automatically propagates to all line items. Sales representatives must manually adjust each line item, which is time-consuming and prone to error, especially on large quotes. This functionality gap complicates the sales process and is a known challenge compared to existing Salesforce CPQ capabilities.

The primary goal of the Header Adjustment - discount feature is to deliver an out-of-the-box solution that empowers sales reps to efficiently apply a single, temporary overall discount at the quote or order header. This improves sales efficiency by reducing manual calculations and simplifying the quoting process.

The key objectives are to:

1. Enable sales reps to easily apply a global discount to a transaction as an amount, percentage, or a total price override.
2. Ensure accurate, automatic distribution of the header discount to all eligible line items.
3. Provide clear visibility into how the header discount affects individual line item pricing through the Price Waterfall.
4. Seamlessly carry over applied header discounts from Quotes to Orders.

Use Cases

Sales Rep Persona:

- **Apply a Percentage Discount:** As a Sales Rep, I want to apply a 10% discount to an entire quote. I can use the "Manage Header Adjustment" action, select "Percentage," and enter "10." The system will automatically calculate and apply the 10% discount to every eligible line item.

- **Apply a Fixed Amount Discount:** As a Sales Rep, I want to apply a \$1000 total discount to an order. Using the "Manage Header Adjustment" action, I can select "Amount," enter "1000," and choose to distribute it either **proportionally** across line items based on their value or **equally** among all eligible lines.
- **Set a Target Total Price:** As a Sales Rep, I need to make a quote total exactly \$9,500 to win a deal. I can select "Override Total," enter "9500" as the value, and the system will calculate the necessary discount amount and distribute it across the line items to reach that target total.
- **View Discount Impact:** As a Sales Rep, I want to see how the header discount affects each line item. I can view the Price Waterfall for any line item to see a distinct entry for the "Header Discount" and understand its impact on the Net Unit Price.
- **Convert Quote to Order:** As a Sales Rep, when I convert a Quote with an applied header discount to an Order, I want the discount details (type, value, logic) to be automatically carried over and applied to the Order without extra work.

Design Time Configuration

Set Up Header Adjustments When Derived Pricing Isn't Used

Configure your Revenue Management pricing procedure to calculate and apply header adjustments when you don't have any products that use derived pricing. Remove derived pricing elements, configure the procedure to use the Discount Distribution Service element, and set your pricing procedure as the default.

Clone Pricing Procedure and Remove Derived Pricing Elements

1. Clone the pricing procedure.
 - a. From the App Launcher, find and select **Pricing Procedures**.
 - b. Click the pricing procedure for Transaction Management.
 - c. Click **Clone**.
 - d. If needed, edit the name and the API name.
 - e. Save your changes.
2. To open your pricing procedure in Expression Set Builder, on the Details tab, in the Pricing Procedure Versions section, click the name of the pricing procedure version.
3. Delete the Derived Pricing elements.
 - a. Click ... (ALT: Settings) on the Derived Price element, and then select **Delete**.

- a. On the List Group element that contains conditions and assignments for derived pricing, click the Show Options button, and then select **Delete**.

Configure Pricing Procedure to Use the Discount Distribution Service Element

1. Add a constant that stores the header distribution type.

- a. Click  (ALT: Resource Manager).
 - b. Click **Add Resource**.
 - c. For Resource Type, select **Constant**.
 - d. For Resource Name, enter *Constant_DDS_NetUnitPrice*.
 - e. For Data Type, select **Text**.
 - f. For Value, enter *NetUnitPrice*.
2. Repeat the previous step to add these constants.
 - a. For Name, enter *Constant_DDS_Amount*; for Type, select Text; and for Value, enter Amount.
 - b. For Name, enter *Constant_DDS_Percentage*; for Type, enter Text; and for Value, enter Percentage.
 - c. For Name, enter *Constant_DDS_Override*; for Type, select Text; and for Value, enter Override.
3. Add a List Group and configure it to assign values when the discount type is Amount.
 - a. After the last component in the pricing procedure, click  (ALT: Add component), and then click **List Group**. A group is added along with the List Operation element.
 - b. From Filter Condition Requirements, select **All Conditions Are Met (AND)**.
 - c. In the Resource field, select **AppliedDiscountAmount__std**, and then in the Operator field, select **Is Not Null**.
 - d. Click **Add Condition**.
 - e. In the Resource field, select **AppliedDiscount__std**, and then in the Operator field, select **Is Null**.
 - f. Click **Add Condition**.
 - g. In the Resource field, select **TotalPriceOverride__std**, and then in the Operator field, select **Is Null**.
 - h. After the List Operation component in the container, click  (ALT: Add component), and then click **Assignment**.
 - i. For Input Variable, select **AppliedDiscountAmount__std**, and for Output Variable, select **HeaderAdjustmentValue__std**.
 - j. Click **Add more variables**.

- k. For Input Variable, select **Constant_DDS_Amount**, and for Output Variable, select **HeaderAdjustmentType__std**.

4. Add a List Group that assigns values when the discount type is Percentage.

- a. After the last component in the pricing procedure, click  (ALT: Add component).
 - b. Click **List Group**. A group is added along with the List Operation element.
 - c. From Filter Condition Requirements, select **All Conditions Are Met (AND)**.
 - d. In the Resource field, select **AppliedDiscount__std**, and then in the Operator field, select **Is Not Null**.
 - e. Click **Add Condition**.
 - f. In the Resource field, select **AppliedDiscountAmount__std**, and then in the Operator field, select **Is Null**.
 - g. Click **Add Condition**.
 - h. In the Resource field, select **TotalPriceOverride__std**, and then in the Operator field, select **Is Null**.
 - i. After the List Operation component in the container, click  (ALT: Add component), and then click **Assignment**.
 - j. For Input Variable, select **AppliedDiscount__std**, and for Output Variable, select **HeaderAdjustmentValue__std**.
 - k. Click **Add more variables**.
 - l. For Input Variable, select **Constant_DDS_Percentage**, and for Output Variable, select **HeaderAdjustmentType__std**.
5. Add a List Group that assigns values to variables when the discount type is Override Total.

- a. After the last component in the pricing procedure, click  (ALT: Add component).
- b. Click **List Group**. A group is added along with the List Operation element.
- c. From Filter Condition Requirements, select **All Conditions Are Met (AND)**.
- d. In the Resource field, select **TotalPriceOverride__std**, and then in the Operator field, select **Is Not Null**.
- e. Click **Add Condition**.
- f. In the Resource field, select **AppliedDiscountAmount__std**, and then in the Operator field, select **Is Null**.
- g. Click **Add Condition**.
- h. In the Resource field, select **AppliedDiscount__std**, and then in the Operator field, select **Is Null**.
- i. After the List Operation component in the container, click  (ALT: Add component), and then click **Assignment**.

- j. For Input Variable, select **TotalPriceOverride__std**, and for Output Variable, select **HeaderAdjustmentValue__std**.
 - k. Click **Add more variables**.
 - l. For Input Variable, select **Constant_DDS_Override**, and for Output Variable, select **HeaderAdjustmentType__std**.
6. Add and configure the Discount Distribution Service element.
- a. After the last component in the pricing procedure, click  (ALT: Add component), and then select Discount Distribution Service.
 - b. Map these input variables.
 - i. Header Discount Type: *HeaderAdjustmentType__std*
 - ii. Header Discount Value: *HeaderAdjustmentValue__std*
 - iii. Header Distribution Logic: *AdjustmentDistributionLogic__std*
 - iv. Header Distribution Type: *Constant_DDS_NetUnitPrice*
 - v. List Price: *NetUnitPrice*
 - vi. Quantity: *LineItemQuantity*
 - vii. Line Item: *LineItem*
 - viii. Input Unit Price: *NetUnitPrice*
 - ix. Header Subtotal: *TotalAmount*
 - x. Minimum Net Unit Price: *MinimumNetUnitPrice*
 - c. Map these output variables.
 - i. Discount Value: *LineItemDiscountValue*
 - ii. Distribution Type: *HeaderDistributionType*
 - iii. Discount Type: *LineItemDiscountType*
 - iv. Net Unit Price: *NetUnitPrice*

v. Subtotal: *ItemNetTotalPrice*

Input Variables (10)		
Header Discount Type *	→	HeaderAdjustmentType_std X
Header Discount Value *	→	HeaderAdjustmentValue_std X
Header Distribution Logic *	→	AdjustmentDistributionLogic_std X
Header Distribution Type *	→	Constant_DDS_NetUnitPrice X
List Price *	→	NetUnitPrice X
Quantity *	→	LineItemQuantity X
Line Item *	→	LineItem X
Input Unit Price	→	NetUnitPrice X
Header Subtotal	→	TotalAmount X
Minimum Net Unit Price	→	MinimumNetUnitPrice X

Output Variables (5)		
Discount Value *	→	LineItemDiscountValue X
Distribution Type *	→	HeaderDistributionType X
Discount Type *	→	LineItemDiscountType X
Net Unit Price	→	NetUnitPrice X
Subtotal	→	ItemNetTotalPrice X

- vi. Save your procedure.
- vii. [Simulate and activate your pricing procedure.](#)

If necessary, you can also set and use floor price limits. See [Discount Distribution Service](#).

Ramp Deal for Groups

Business Objective

The primary goal of the **Ramp Deal for Group** feature is to fundamentally simplify the management of complex, multi-year deals. It allows sales reps to structure a ramped transaction using time-based segments and assetizes the entire deal into a **single asset**. This consolidated asset tracks all variations in quantity, configuration, and pricing across its lifecycle, streamlining asset management and providing a unified view of the customer's commitment.

The key objectives are to:

- Enable the creation of a single, consolidated asset for an entire ramped quote, simplifying asset lifecycle management.
- Support the ramping of complex products, including Bundles and Usage-based items, within a single, coherent structure.
- Allow for segment-specific configurations, enabling changes to bundle components, product attributes, and quantities from one period to the next.
- Drastically simplify downstream processes like amendments, renewals, and cancellations by operating on one single master asset.

Use Cases

Sales Rep Persona:

- **Structure a Multi-Year Deal:** As a Sales Rep, I need to create a 3-year deal for a customer who is increasing licenses each year. I can create a Group Ramp with three segments (e.g., Year 1, Year 2, Year 3), set the specific quantity and discount for each year, and the system will generate one single asset representing the entire 3-year term.
- **Ramp a Configurable Bundle:** As a Sales Rep, I'm selling a solution bundle where the customer wants to add a "Premium Support" package starting in Year 2. I can configure the bundle for the first segment, then clone it and modify the configuration for the second segment to include the new support package. These changes are all tracked within the same consolidated asset.
- **Quickly Extend a Ramp Schedule:** As a Sales Rep, after configuring the first year of a deal, I can use the "Clone as Segment" action. This automatically creates the next segment with all the same products, and the dates are perfectly aligned, saving

significant time when building out long-term quotes.

- **Amend a Ramped Deal Mid-Term:** As a Sales Rep, my customer, who is halfway through Year 2 of their 4-year ramp deal, needs to increase their license count. I can initiate an amendment on their single ramped asset. The system will present the past segments as read-only and allow me to easily update the quantities for the current and all future segments.
- **View the Full Deal Lifecycle:** As a Sales Rep, I need a clear overview of a specific product's ramp schedule within a large quote. I can use the "View Ramp Details" action on the line item to see a pop-up summary showing the quantity, pricing, and duration for every segment that product is a part of.

Deep Clone Quotes and Orders

Business Objective

Sales reps need the ability to clone quotes and orders, including related entities like quote line items and order products.

Use Cases

Use Case 1:

Sales Reps want the ability to share multiple different iterations of a Quote, which may require cloning the Quote and then modifying certain products to show different options to their end-customer.

Use Case 2:

Order managers might need to place an Order that is exactly the same as a previous Order for their customer. To simplify this process, they can simply clone the previous Order and place the new Order again.

Design Time Configuration

1. Enable the '**Clone Quotes and Orders**' setting under Revenue Settings

Clone Quotes and Orders

Clone quotes or orders with their line items and groups, or clone the individual line items and groups of line items.

a.

2. Add the '**Deep Clone**' action button to the Quote and/or Order page layout

[illegible]

- a.
- b. Object Manager
- c. Quote
- d. Page Layout
- e. Mobile & Lightning Actions
- f. Add Deep Clone to the layout
- g. Save

Transfer Assets to Another Account

Business Objective

Transfer assets from one account to another, streamlining your sales and operations processes while maintaining compliance. This feature allows you to efficiently manage product licenses and subscriptions by moving quantities of assets between different accounts or contracts.

Use Case

For instance, if Account Y has 500 Sales Cloud licenses and needs to transfer 200 to its subdivision, Account Z, this feature reduces Account Y's license count by 200 and creates a new asset with a +200 quantity on Account Z. This capability is crucial for SOX compliance and verifies the quantity reduction in one account is directly related to a quantity increase in another, avoiding manual “rip and replace” processes.

Run Time Configuration

To Transfer an Asset:

1. From the account page, select an asset on the Managed Assets viewer.
2. Select Transfer from the dropdown.
3. On the New Transfer Details screen, select a Transfer Start Date and update Transfer To Account. Optionally, select a Transfer To Contract. Click Submit.

New Transfer Details

Transfer assets by selecting a transfer start date and an account. Optionally, select a contract.

* **Transfer Start Date**

* **Transfer to Account**

Transfer to Contract

Search Accounts... Search Contracts...

Submit

Two quotes are created: A source quote shows the quantity reduction on the original account, and a destination quote shows the new sale on the target account.

The source quote has an Action Type of Amend and Subtype of TransferFrom.

The destination quote has an Action Type of Add and Subtype of TransferTo.

The quote header's Original Action Type updates to Transfer.

Initially, quantities on the quotes default to the full asset quantity, but you can adjust them for partial transfers.

4. On the source or destination quote, select Create Order to generate both a source and a destination orders.

You'll see a success message, linking to the order you initiated the action from, with an additional message confirming the creation of the second order.

5. On the Account page related tab, you'll see new orders in Draft status.
6. Activate the source order first, followed by the destination order.

Quote Line Import from CSV

Business Objective

Currently, sales representatives waste valuable time manually adding numerous products to quotes one by one. This process involves excessive clicks and screen navigation, leading to delays in quote delivery and hindering the ability to close deals efficiently, especially for large, complex quotes with hundreds of line items. Sales reps often prepare quotes in spreadsheets but lack a direct way to import this data, creating a significant workflow bottleneck.

The primary goal of the **Import CSV to Quote** feature is to deliver a streamlined, out-of-the-box solution that empowers sales reps to quickly create base quotes by importing product lines directly from a CSV file. This feature is designed to drastically reduce manual effort, ensure data accuracy through robust validation, and accelerate the entire quote-to-customer process.

The key objectives are to:

- **Enable fast and easy quote creation** by importing product lines from a CSV file in a simple, guided workflow.
- **Ensure data accuracy and validity** with built-in validation for product codes, selling models, and other data, providing clear error logs for easy correction.
- **Improve sales productivity** by minimizing the time spent on manual data entry, allowing reps to focus on selling and closing deals faster.
- **Provide scalability** to handle large quotes with up to 5,000 line items, overcoming the limitations of manual creation

Use Case

Sales Rep Persona:

- **Quickly Create a Large Quote:** As a Sales Rep, I need to generate a quote with over 200 different products. I can prepare the list of products, quantities, and discounts in a CSV file using a provided template. Then, I use the "Import Lines" action on the quote, upload my file, and the system asynchronously adds all 200+ line items to my quote, saving me hours of manual work.

- **Handle Import Errors Efficiently:** As a Sales Rep, I've uploaded a CSV file, but the import completed with errors. I receive a notification and can download a detailed error log that specifies which rows in my CSV failed and why (e.g., "Invalid ProductCode" on SrNo 5). I can quickly correct the errors in my original file and re-upload it to complete the import.
- **Choose How to Handle Errors:** As a Sales Rep preparing an urgent quote, I want to import all correct lines immediately, even if a few have errors. During the upload process, I can use the default option to "Import valid lines and display errors," allowing a partial import to proceed without being blocked by a few mistakes.
- **Finalize and Price the Quote:** As a Sales Rep, after the line items have been successfully imported, they appear on the quote. I can then click the "Refresh Quote" action to trigger the pricing, configuration, and validation engine, which applies all product defaults, rules, and discounts to finalize the quote for the customer.

Design Time Configuration

Follow these steps to configure and enable the Import CSV to Quote feature. The setup involves assigning permissions, enabling the feature toggle, and configuring the underlying data processing engine Definition.

1. Assign User Permissions

First, grant access to the necessary users, such as administrators or sales operations teams, who will manage or use the import feature.

- Navigate to **Setup**.
- In the Quick Find box, enter **Permission Sets**.
- Select the **Advanced CSV Data Import** permission set.
- Assign this permission set to the relevant users.

2. Enable the Import Feature and Configure the Data Processing Engine

Next, enable the feature in Revenue Cloud settings and link it to the correct Data Processing Engine (DPE) Definition. The feature ships with a pre-built template for this purpose.

1. **Clone the DPE Definition:**

- From **Setup**, search for and select **Data Processing Engine**.
- Find the pre-built template named **Create Quote Line Items from a CSV File** and open it.
- Clone this definition to create your own copy. You can rename it if needed.
- After cloning, **activate** your new version. This makes it available for use in the import process.

2. **Enable the Feature in Revenue Settings:**

- From **Setup**, search for and select **Revenue Settings**.
- Locate the setting **Import Quote Line Items** and enable the toggle.
- In the **Data Processing Engine Definition for Importing Quote Line Items** field, select the DPE Definition you just cloned and activated.
- Click **Save**. The feature is now enabled and ready for use by sales reps.
